# G.C.E. (A/L) Examination - 2021 (2022) 

## 02 - Chemistry

## Distribution of Marks

Paper I : $1 \times 50$ ..... $=50$
Paper II :
Part A : $100 \times 4$ ..... $=400$
Part B : $150 \times 2$ ..... $=300$
Part C : $150 \times 2$ ..... $=300$
Total $=1000$
Paper II - Final Marks ..... $=100$

## Common Techniques of Marking Answer Scripts.

It is compulsory to adhere to the following standard method in marking answer scripts and entering marks into the mark sheets.

1. Use a red color ball point pen for marking. (Only Chief/Additional Chief Examiner may use a mauve color pen.)
2. Note down Examiner's Code Number and initials on the front page of each answer script.
3. Write off any numerals written wrong with a clear single line and authenticate the alterations with Examiner's initials.
4. Write down marks of each subsection in a
 and write the final marks of each question as a rational number in a $\square$ with the question number. Use the column assigned for Examiners to write down marks.

## MCQ answer scripts: (Template)

1. Marking templets for G.C.E.(A/L) and GIT examination will be provided by the Department of Examinations itself. Marking examiners bear the responsibility of using correctly prepared and certified templates.
2. Then, check the answer scripts carefully. If there are more than one or no answers Marked to a certain question write off the options with a line. Sometimes candidates may have erased an option marked previously and selected another option. In such occasions, if the erasure is not clear write off those options too.
3. Place the template on the answer script correctly. Mark the right answers with a ' $V$ ' and the wrong answers with a ' $X$ ' against the options column. Write down the number of correct answers inside the cage given under each column. Then, add those numbers and write the number of correct answers in the relevant cage.

## structured essay type and assay type answer scripts:

1. Cross off any pages left blank by candidates. Underline wrong or unsuitable answers. Show areas where marks can be offered with check marks.
2. Use the right margin of the overland paper to write down the marks.
3. Write down the marks given for each question against the question number in the relevant cage on the front page in two digits. Selection of questions should be in accordance with the instructions given in the question paper. Mark all answers and transfer the marks to the front page, and write off answers with lower marks if extra questions have been answered against instructions.
4. Add the total carefully and write in the relevant cage on the front page. Turn pages of answer script and add all the marks given for all answers again. Check whether that total tallies with the total marks written on the front page.

## Preparation of Mark Sheets.

Except for the subjects with a single question paper, final marks of two papers will not be calculated within the evaluation board this time. Therefore, add separate mark sheets for each of the question paper. Write paper 01 marks in the paper 01 column of the mark sheet and write them in words too. Write paper II Marks in the paper II Column and wright the relevant details.

## Instructions:

* Periodic Table is provided.
* This paper consists of 09 pages.
* Answer all the questions.
* Use of calculators is not allowed.
* Write your Index Number in the space provided in the answer sheet.
* Follow the instructions given on the back of the answer sheet carefully.
* In each of the questions $\mathbf{1}$ to $\mathbf{5 0}$, pick one of the alternatives from (1), (2), (3), (4), (5) which is correct or most appropriate and mark your response on the answer sheet with a cross $(\mathrm{x})$ in accordance with the instructions given on the back of the answer sheet.
Universal gas constant $R=8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \quad$ Planck's constant $h=6.626 \times 10^{-34} \mathrm{~J} \mathrm{~s}$
Avogadro constant $\quad N_{A}=6.022 \times 10^{23} \mathrm{~mol}^{-1} \quad$ Velocity of light $c=3 \times 10^{8} \mathrm{~m} \mathrm{~s}^{-1}$

1. Select the correct statement with regard to particles associated with cathode rays observed in a cathode ray tube.
(1) The particles are uncharged.
(2) They travel from anode to cathode along straight lines.
(3) Their charge to mass ratio $\frac{e}{m}$ depends on the nature of gas and pressure inside the cathode ray tube.
(4) Their direction of travel is affected by magnetic and electric fields.
(5) They are not capable of ionizing the gas inside the cathode ray tube.
2. Which of the following statements is incorrect with regard to an energy level of an atom with principal quantum number $(\mathrm{n}), \mathrm{n}=3$ ?
(1) There are 3 sub shells associated with it.
(2) There are 9 orbitals.
(3) There can be a maximum of 18 electrons.
(4) There can be a maximum of 10 electrons with angular momentum (azimuthal) quantum number $(l), l=2$.
(5) There can be a maximum of 8 electrons with magnetic quantum number $\left(\mathrm{m}_{l}\right), \mathrm{m}_{l}=0$.
3. The decreasing order of the first ionization energy of the atoms $\mathrm{H}, \mathrm{He}, \mathrm{Li}, \mathrm{Be}, \mathrm{B}$ and Na is,
(1) $\mathrm{He}>\mathrm{H}>\mathrm{B}>\mathrm{Be}>\mathrm{Li}>\mathrm{Na}$
(2) $\mathrm{He}>\mathrm{H}>\mathrm{Be}>\mathrm{B}>\mathrm{Li}>\mathrm{Na}$
(3) $\mathrm{He}>\mathrm{Be}>\mathrm{H}>\mathrm{Li}>\mathrm{B}>\mathrm{Na}$
(4) $\mathrm{H}>\mathrm{He}>\mathrm{B}>\mathrm{Be}>\mathrm{Li}>\mathrm{Na}$
(5) $\mathrm{H}>\mathrm{He}>\mathrm{Be}>\mathrm{B}>\mathrm{Na}>\mathrm{Li}$
4. The shapes of $\mathrm{IF}_{4}^{+}, \mathrm{IF}_{4}^{-}$and $\mathrm{IF}_{5}$ are respectively,
(1) see-saw, square planar and square pyramidal.
(2) square planar, see-saw and square pyramidal.
(3) tetrahedral, see-saw and trigonal bipyramidal.
(4) see-saw, tetrahedral and square pyramidal.
(5) tetrahedral, square planar and trigonal bipyramidal.
5. What is the IUPAC name of the following compound?

(1) 1-amino-4-ethylpent-4-en-3-ol
(2) 5-amino-2-ethylpent-1-en-3-ol
(3) 2-ethyl-3-hydroxypent-1-en-5-amine
(4) 4-ethyl-3-hydroxypent-4-en-1-amine
(5) 5-amino-2-ethyl-3-hydroxypent-1-ene
6. Which of the following statements is correct with regard to boiling points?
(1) $\mathrm{N}_{2}$ has a higher boiling point than NO .
(2) $\mathrm{PH}_{3}$ has a higher boiling point than $\mathrm{NH}_{3}$.
(3) Xe has a higher boiling point than Kr .
(4) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$ has a higher boiling point than $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$.
(5) $\mathrm{CH}_{3} \mathrm{CHCH}_{3}$ has a higher boiling point than $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$.
7. $\mathrm{M}(\mathrm{OH})_{2}$ is a sparingly water soluble solid. The concentration of $\mathrm{M}^{2+}(\mathrm{aq})$ in a saturated aqueous solution of $\mathrm{M}(\mathrm{OH})_{2}$ at $\mathrm{pH}=8.0$ and at a given temperature is $1.0 \times 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3}$. The pH of a saturated aqueous solution of $\mathrm{M}(\mathrm{OH})_{2}$ having $\mathrm{M}^{2+}(\mathrm{aq})$ concentration of $1.0 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$ at this temperature is,
(1) 4.0
(2) 5.0
(3) 6.0
(4) 7.0
(5) 8.0
8. Select the correct statement.
(1) The electron pair geometry and shape of $\mathrm{SF}_{5}^{+}$are different from each other.
(2) The increasing order of radii of atoms/ions $\mathrm{F}^{-}, \mathrm{Mg}^{2+}, \mathrm{Al}, \mathrm{Cl}^{-}$and K is $\mathrm{F}^{-}<\mathrm{Mg}^{2+}<\mathrm{Cl}^{-}<\mathrm{Al}<\mathrm{K}$.
(3) The number of resonance structures that can be drawn for nitric acid $\left(\mathrm{HNO}_{3}\right)$ is four.
(4) $\mathrm{CO}_{3}^{2-}$ has the longest $\mathrm{C}-\mathrm{O}$ bond among the molecules/ions $\mathrm{CO}, \mathrm{CO}_{2}, \mathrm{CO}_{3}^{2-}$ and $\mathrm{CH}_{3} \mathrm{OH}$.
(5) Among the molecules $\mathrm{CH}_{4}, \mathrm{COCl}_{2}$ and HCN , the electronegativity of the carbon atom increases in the order $\mathrm{CH}_{4}<\mathrm{COCl}_{2}<\mathrm{HCN}$.
9. A and B are two organic compounds containing C, H and O. When A and B were separately treated with $\mathrm{Br}_{2} / \mathrm{H}_{2} \mathrm{O}$, only $\mathbf{A}$ gave a white precipitate. The product formed when $\mathbf{B}$ was heated with concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ decolourised $\mathrm{Br}_{2} / \mathrm{H}_{2} \mathrm{O}$. The organic compounds $\mathbf{A}$ and $\mathbf{B}$ are respectively,

> (1)

(4) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CHO}$,
$\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}$
(5)

10. The elementary reaction $\mathrm{A}(\mathrm{g}) \rightarrow \mathrm{B}(\mathrm{g})+\mathrm{C}(\mathrm{g})$ occurs in a closed rigid container at constant temperature. The initial pressure of the container when only $\mathrm{A}(\mathrm{g})$ is present was measured to be $2 P_{0}$. The pressure of the container after two half lives of $\mathrm{A}(\mathrm{g})$ would be,
(1) $\frac{P_{0}}{2}$
(2) $\frac{P_{0}}{4}$
(3) $\frac{3 P_{0}}{4}$
(4) $\frac{3 P_{0}}{2}$
(5) $\frac{7 P_{0}}{2}$
11. A suitable method to prepare
 is,
(1)

(2)

$\xrightarrow[\text { (2) } \mathrm{Br}_{2} / \mathrm{FeBr}_{3}]{\text { (1) } \mathrm{NaNO}_{2} / \text { dilute } \mathrm{HCl} / 0-5}{ }^{\circ} \mathrm{C}$
(3)

(1) $\mathrm{NaNO}_{2} /$ dilute $\mathrm{HCl} / 0-5^{\circ} \mathrm{C}$
(2) CuBr
(4)

(5)
 $\xrightarrow{\mathrm{Br}_{2}}$
(1) $\mathrm{NaNO}_{2}$ / dilute $\mathrm{HCl} / 25^{\circ} \mathrm{C}$
(2) CuBr
12. Which expression gives the correct volume $\left(\mathrm{cm}^{3}\right)$ of $70.0 \%\left(\frac{w}{w} \%\right)$ concentrated $\mathrm{HNO}_{3}$ acid with density $1.42 \mathrm{~g} \mathrm{~cm}^{-3}$ required to prepare $300 \mathrm{~cm}^{3}$ of a $0.150 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of $\mathrm{HNO}_{3}$ ? (Relative atomic mass: $\mathrm{H}=1, \mathrm{~N}=14, \mathrm{O}=16$ )
(1) $\frac{100}{1.42} \times \frac{70.0}{63} \times \frac{0.150}{1000} \times 300$
(2) $\frac{100}{1.42} \times \frac{63}{70.0} \times \frac{0.150}{1000} \times 300$
(3) $\frac{1.42}{100} \times \frac{63}{70.0} \times \frac{1000}{0.150} \times 300$
(4) $\frac{100}{1.42} \times \frac{63}{70.0} \times \frac{1000}{0.150} \times \frac{1}{300}$
(5) $\frac{1.42}{100} \times \frac{70.0}{63} \times \frac{0.150}{1000} \times 300$
13. The elementary reaction, $\mathrm{A}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \rightarrow \mathrm{B}^{+}(\mathrm{aq})$ occurs in an aqueous solution at constant temperature. Which of the following graphs correctly represents the relationship between $\log$ (Initial rate) vs pH at a constant concentration of $\mathrm{A}(\mathrm{aq})$ ?
$\log$ (Initial rate) $\log$ (Initial rate) $\log$ (Initial rate) $\log$ (Initial rate) $\log$ (Initial rate)

(1)

(2)

(3)

(4)

(5)
14. An excess amount of $\mathrm{A}(\mathrm{g})$ and a small amount of $\mathrm{B}(\mathrm{g})$ are introduced into an evacuated rigid container. Then, the following elementary reactions take place at a constant temperature.

$$
\begin{array}{ll}
\mathrm{A}(\mathrm{~g})+\mathrm{B}(\mathrm{~g}) \rightarrow \mathrm{C}(\mathrm{~g}) & \text { fast } \\
\mathrm{A}(\mathrm{~g})+\mathrm{C}(\mathrm{~g}) \rightarrow 3 \mathrm{D}(\mathrm{~g}) & \text { slow }
\end{array}
$$

Which of the following statements is correct regarding the variation of pressure of the system with time?
(1) Pressure remains unchanged.
(2) Pressure increases and then becomes constant.
(3) Pressure decreases and then becomes constant.
(4) Pressure decreases and returns to the initial value again.
(5) Pressure increases initially, then decreases and returns to the initial value again.
15. The solute $\mathbf{A}$ present in volume V of an aqueous solution is extracted twice using 2 V volume portions of a water immiscible organic solvent. The partition coefficient of $\mathbf{A}$ between the organic solvent and water, $\frac{[\mathbf{A}]_{\text {(org) }}}{[\mathbf{A}]_{(\mathrm{aq})}}=4.0$. The initial amount of $\mathbf{A}$ in the aqueous phase is $a$ (mol). The amount (mol) of $\mathbf{A}$ remaining in the aqueous phase after the second extraction is,
(1) $\frac{a}{2}$
(2) $\frac{a}{9}$
(3) $\frac{a}{18}$
(4) $\frac{a}{25}$
(5) $\frac{a}{81}$
16. Compound $\mathbf{A}$ reacts with $\mathrm{NaNO}_{2} /$ dilute HCl to give $\mathbf{B}$. When $\mathbf{B}$ is treated with acidified aqueous $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$, the solution turns green. When treated with Fehling's reagent $\mathbf{A}$ did not give a brick red precipitate. Compound A could be,
(1)

(2)

(3)

(4)

(5)

17. $\mathrm{MCl}_{2}$ is a solid which is sparingly soluble in water $\left(K_{s p}=1.0 \times 10^{-8} \mathrm{~mol}^{3} \mathrm{dm}^{-9}\right)$. Which of the following is correct regarding a saturated aqueous solution of $\mathrm{MCl}_{2}$ ?
(1) Evaporation of water from the solution increases $\mathrm{M}^{2+}$ and chloride ion concentrations of the solution.
(2) Chloride ion concentration of the solution can be increased by adding $\mathrm{NaCl}(\mathrm{s})$.
(3) The solution cannot be acidified by adding HCl .
(4) Chloride ion concentration of the solution cannot be increased above $1.0 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$.
(5) Chloride ion concentration of the solution can be lowered by adding distilled water and maintaining the saturated condition.
18. When a mass of 0.0119 g of KBr is dissolved in $500.0 \mathrm{~cm}^{3}$ of distilled water, the $\mathrm{K}^{+}$composition of the solution in $\mathrm{mol} \mathrm{dm}^{-3}$ and ppm ( $\mathrm{mg} \mathrm{kg}^{-1}$ ) are respectively,
(Relative atomic mass: $\mathrm{K}=39, \mathrm{Br}=80$; density of solution $=1.00 \mathrm{~kg} \mathrm{dm}^{-3}$ )
(1) $1.0 \times 10^{-4}$ and 3.9
(2) $1.0 \times 10^{-4}$ and 7.8
(3) $2.0 \times 10^{-4}$ and 1.3
(4) $2.0 \times 10^{-4}$ and 3.9
(5) $2.0 \times 10^{-4}$ and 7.8
19. The correct reaction relevant to the standard enthalpy of hydration of the sodium ion is,
(1) $\mathrm{Na}^{+}(\mathrm{g})+\mathrm{OH}^{-}(\mathrm{aq}) \longrightarrow \mathrm{NaOH}(\mathrm{s})$
(2) $\mathrm{NaCl}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \longrightarrow \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq})$
(3) $\mathrm{Na}^{+}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(l) \longrightarrow \mathrm{Na}^{+}(\mathrm{aq})$
(4) $\mathrm{Na}^{+}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(l) \longrightarrow \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{OH}^{-}($aq $)+\mathrm{H}^{+}(\mathrm{aq})$
(5) $\mathrm{Na}^{+}(\mathrm{g})+\mathrm{Cl}^{-}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(l) \longrightarrow \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})$
20. Which of the following is not a step in the chlorination of methane?
(1) $\mathrm{Cl}_{2} \xrightarrow{h v} 2 \mathrm{Cl}^{\bullet}$
(2) $\mathrm{CH}_{4}+{ }^{\circ} \mathrm{Cl} \longrightarrow{ }^{\circ} \mathrm{CH}_{3}+\mathrm{HCl}$
(3) ${ }^{\circ} \mathrm{CH}_{3}+\mathrm{Cl}_{2} \longrightarrow \mathrm{CH}_{3} \mathrm{Cl}+\mathrm{Cl}^{\bullet}$
(4) $\mathrm{CH}_{3} \mathrm{Cl}+\mathrm{Cl}^{\bullet} \longrightarrow{ }^{*} \mathrm{CH}_{2} \mathrm{Cl}+\mathrm{HCl}$
(5) ${ }^{\circ} \mathrm{CH}_{2} \mathrm{Cl}+\mathrm{HCl} \longrightarrow \mathrm{CH}_{2} \mathrm{Cl}_{2}+\mathrm{H}^{*}$
21. Which of the following statements regarding the critical temperature of a real gas is correct?
(1) It is the temperature at which the intermolecular forces can be neglected.
(2) It is the temperature corresponding to the lowest pressure at which the gas can be liquified.
(3) It is the temperature at which the gas is in equilibrium with its solid.
(4) It is the highest temperature at which the gas phase and the liquid phase are in equilibrium.
(5) It is the temperature given by the van der Waals equation at any pressure.
22. In an experiment, Mg metal was made to react with excess $\mathrm{N}_{2}$ gas and the product obtained was reacted with $\mathrm{H}_{2} \mathrm{O}$. The volume of the gas evolved at standard temperature ( 273 K ) and pressure ( 1.0 atm ) was $672 \mathrm{~cm}^{3}$. The mass of Mg used in the experiment is,
(Assume that 1.0 mol of gas occupies a volume of $22.4 \mathrm{dm}^{3}$ at 273 K and 1.0 atm .
Relative atomic mass: $\mathrm{Mg}=24$ )
(1) 0.24 g
(2) 0.48 g
(3) 0.72 g
(4) 1.08 g
(5) 1.50 g
23. The mean square speed of $\mathrm{H}_{2}$ at absolute temperature $T$ is equal to the mean square speed of $\mathrm{N}_{2}$ at absolute temperature $T^{\prime}$. Which of the following equations gives the correct relationship between $T$ and $T^{\prime}$ ? (Relative atomic mass: $\mathrm{H}=1, \mathrm{~N}=14$ )
(1) $T=T^{\prime}$
(2) $T=14 T^{\prime}$
(3) $T=\frac{T^{\prime}}{4}$
(4) $T=7 T^{\prime}$
(5) $T=\frac{T^{\prime}}{14}$
24. A buffer solution at constant temperature contains a monobasic weak acid ( $K_{a}=1.00 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$ ) and its sodium salt. The concentrations of the weak acid and the sodium salt in the solution are $0.10 \mathrm{~mol} \mathrm{dm}^{-3}$ each. The volume of $1.00 \mathrm{~mol} \mathrm{dm}^{-3}$ weak acid that should be added to change the pH of $10.00 \mathrm{~cm}^{3}$ of this solution by one unit, and the pH value of the solution after the addition of the weak acid are respectively,
(1) $9.00 \mathrm{~cm}^{3}, 4.0$
(2) $9.00 \mathrm{~cm}^{3}, 6.0$
(3) $10.00 \mathrm{~cm}^{3}, 4.0$
(4) $10.00 \mathrm{~cm}^{3}, 5.0$
(5) $11.00 \mathrm{~cm}^{3}, 4.0$
25. A gaseous discharge/production that contributes to all three environmental issues, namely, global warming, acid rain and photochemical smog is,
(1) exhaust gas released from fossil fuel burning vehicles.
(2) exhaust gas released from coal power plants.
(3) gases released during repair of air conditioners and refrigerators.
(4) gases produced from the improper discharge of municipal solid waste.
(5) exhaust gas released from biofuel burning vehicles.
26. Which of the following statements is incorrect with regard to element Lithium ( Li ) and its compounds?
(1) Among the Group I elements from $\mathrm{Li}-\mathrm{Cs}$, lithium has the most negative value for electron gain energy.
(2) Lithium forms two products when heated in air.
(3) Considering the gases evolved, upon heating $\mathrm{LiNO}_{3}(\mathrm{~s})$ produces two gases whereas $\mathrm{Li}_{2} \mathrm{CO}_{3}(\mathrm{~s})$ gives only one gas.
(4) Among Group I elements, lithium has the weakest metallic bonding.
(5) Lithium gives a red coloured flame in the flame test.
27. The number of moles of $\mathrm{KMnO}_{4}$ that are required to react completely with one mole of $\mathrm{Fe}\left(\mathrm{NO}_{2}\right)_{2}$ in acidic medium is,
(Note: Neglect the loss of $\mathrm{NO}_{2}^{-}$due to acidic conditions.)
(1) $\frac{3}{5}$
(2) $\frac{4}{5}$
(3) 1
(4) $\frac{5}{4}$
(5) $\frac{5}{3}$
28. Which of the following statements is correct regarding water and aqueous solutions at a given temperature?
(1) The solubility of a polar gas in water is lower than the solubility of a non polar gas in water.
(2) Any gas undergoes ionization in an aqueous solution.
(3) The solubility of a gas in water is proportional to its pressure.
(4) Boiling point of water decreases with increasing pressure.
(5) The temperature of the triple point of water increases with increasing pressure.
29. Select the correct statement with regard to chromium $(\mathrm{Cr})$ and its compounds.
(1) When an aqueous solution of $\mathrm{K}_{2} \mathrm{CrO}_{4}$ is treated with dilute $\mathrm{H}_{2} \mathrm{SO}_{4}$, a colour change is not observed.
(2) The electronegativity of Cr is greater than that of Co .
(3) An aqueous solution of $\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}^{2+}$ when treated with excess NaOH , followed by the addition of $\mathrm{H}_{2} \mathrm{O}_{2}$ gives a yellow coloured solution.
(4) $\mathrm{Cr}_{2} \mathrm{O}_{3}$ shows basic properties.
(5) When $\mathrm{H}_{2} \mathrm{~S}$ gas is passed into an acidic solution of $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$, a clear green coloured solution is observed.
30. Which of the following statements is incorrect regarding carboxylic acids?
(1) The product formed by the reaction of a carboxylic acid with $\mathrm{LiAlH}_{4}$ gives an alcohol upon hydrolysis.
(2) Carbon dioxide is liberated when carboxylic acids are reacted with aqueous NaOH .
(3) Carboxylic acids react with $\mathrm{PCl}_{5}$ to give acid chlorides.
(4) Methane is liberated when carboxylic acids are reacted with $\mathrm{CH}_{3} \mathrm{MgBr}$.
(5) Carboxylic acids are formed when aldehydes are treated with $\mathrm{H}^{+} / \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$.

- For each of the questions $\mathbf{3 1}$ to $\mathbf{4 0}$, one or more responses out of the four responses $(a),(b)$, (c) and (d) given is/are correct. Select the correct response/responses. In accordance with the instructions given on your answer sheet, mark
(1) if only $(a)$ and $(b)$ are correct.
$(2)$ if only $(b)$ and $(c)$ are correct.
(3) if only $(c)$ and $(d)$ are correct.
(4) if only $(d)$ and $(a)$ are correct.
(5) if any other number or combination of responses is correct.

Summary of above Instructions

| $(1)$ | $(2)$ | $(3)$ | $(4)$ | $(5)$ |
| :---: | :---: | :---: | :---: | :---: |
| Only $(a)$ and $(b)$ <br> are correct | Only $(b)$ and $(c)$ <br> are correct | Only $(c)$ and $(d)$ <br> are correct | Only $(d)$ and $(a)$ <br> are correct | Any other number or <br> combination of responses <br> is correct |

31. Which of the following give(s) 3-bromo-3-methylhexane as the major product when reacted with HBr ?
(a)

(b)

(c)

(d)

32. Which of the following statements is/are correct regarding products related to plant sources?
(a) Essential oils contain complex mixtures of volatile constituents of plants.
(b) Biodiesel is produced from volatile plant oils.
(c) Methanol is not used in the production of biodiesel.
(d) Ethanol produced by fermentation of plant materials is regarded as a renewable energy source.
33. On which of the following factor/factors does the electrode potential of the electrode $M^{2+}(a q) / M(s)$ depend?
(a) Surface area of $\mathrm{M}(\mathrm{s})$
(b) Concentration of $\mathrm{M}^{2+}(\mathrm{aq})$
(c) Temperature
(d) Volume of $\mathrm{M}^{2+}(\mathrm{aq})$ solution
34. Which of the following give(s) $\mathrm{CO}_{2}$ when treated with aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ ?
(a)

(b)

(c)

(d)

35. Which of the following statements is/are always correct regarding an aqueous solution of a weak electrolyte?
(a) When conducting an electric current, the fraction of the current carried by the anion is greater than the fraction of the current carried by the cation.
(b) The conductivity of the anion is greater than the conductivity of the cation.
(c) Only a small percentage of molecules of the weak electrolyte is dissociated into ions.
(d) The fraction of molecules of the weak electrolyte dissociated increases with dilution.
36. Which of the following statements is/are correct regarding the relationship between global environmental issues and volatile halogenated hydrocarbons?
(a) CFC, HCFC and HFC all three contribute to global warming.
(b) CFC contributes to ozone layer depletion by producing chlorine radicals in the troposphere.
(c) HFC contributes to ozone layer depletion by producing chlorine radicals in the stratosphere.
(d) Both CFC and HCFC contribute to ozone layer depletion by producing chlorine radicals in the stratosphere.
37. Which of the following statements is/are correct with regard to the two allotropes of carbon, namely, graphite and diamond?
(a) Carbon atoms in diamond are tetrahedrally surrounded by four other carbon atoms to give a three-dimensional lattice.
(b) Because graphite is composed of two-dimensional layers held together by weak van der Waals forces (secondary interactions), it acts as a good lubricant.
(c) Diamond is a good conductor of heat and electricity.
(d) Graphite has a considerably higher melting point than diamond.
38. Which of the following statements is/are correct regarding gases?
(a) Molecules move at different speeds in a sample of a real gas whereas all the molecules move at the same speed in a sample of an ideal gas.
(b) Ideal gases can be liquified at extremely high pressures.
(c) The Maxwell-Boltzmann speed distribution curve of an ideal gas is symmetric about the maximum point.
(d) The compressibility factor of a real gas depends on pressure.
39. 

Which of the following statements is/are correct regarding the phase diagram of a pure substance given above?
(a) The number of molecules in a unit volume is always higher in the gas phase than in the liquid phase.
(b) The liquid phase and the gas phase never co-exist at the same temperature.
(c) The solid phase and the gas phase never co-exist at the same pressure.
(d) When the system is at the triple point, the rate at which the gas is converted to the liquid is equal to the rate at which the liquid is converted to the gas.
40. Which of the following statements is/are correct regarding the given industrial processes?
(a) Sea water can be used directly as a raw material in the extraction of Mg by the Dow process.
(b) In the production of NaOH , the use of membrane cells is more environmentally friendly than the use of mercury cells.
(c) The efficiency of the Solvay process used to produce $\mathrm{Na}_{2} \mathrm{CO}_{3}$ can be increased by cooling the ammonification tower.
(d) Rh metal is used as a catalyst in the production of $\mathrm{H}_{2} \mathrm{SO}_{4}$ by the contact process.

- In question Nos. $\mathbf{4 1}$ to $\mathbf{5 0}$, two statements are given in respect of each question.

From the Table given below, select the response, out of the responses (1), (2), (3), (4) and (5), that best fits the two statements and mark appropriately on your answer sheet.

| Response | First Statement | Second Statement |
| :---: | :---: | :--- |
| $(1)$ | True | True, and correctly explains the first statement |
| $(2)$ | True | True, but does not explain the first statement correctly |
| $(3)$ | True | False |
| $(4)$ | False | True |
| $(5)$ | False | False |

41. 

| First Statement |
| :--- |
| When an acidic solution of $\mathrm{MnO}_{4}^{-}$is treated |
| with $\mathrm{H}_{2} \mathrm{O}_{2}$, it turns colourless with the evolution | of $\mathrm{O}_{2}$, whereas, an acidic solution of $\mathrm{Fe}^{2+}$ on treatment with $\mathrm{H}_{2} \mathrm{O}_{2}$ turns yellow-brown.

42. Energy of a gas in a closed rigid container with thermally insulated walls remains constant.
43. $\mathrm{Cl}_{2}$ gas undergoes disproportionation on reaction with water giving $\mathrm{HOCl}(\mathrm{aq})$ and $\mathrm{HCl}(\mathrm{aq})$.
44. When a catalyst is added, the position of equilibrium of a reversible reaction changes.
45. $\mathrm{RC} \equiv \mathrm{CMgBr}$ can be prepared by the reaction between $\mathrm{RC} \equiv \mathrm{CH}$ and methylmagnesium bromide.
46. Reaction of HCN with any aldehyde gives a product containing a chiral carbon atom.

A carbon atom joined to four different groups is called a chiral carbon atom.
47. The main by-product in the production of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ by the Solvay process is $\mathrm{CaCl}_{2}$.
48. Benzenediazonium chloride reacts with phenol in the presence of aqueous NaOH to give the following compound.

49. When strong acids are titrated with aqueous ammonia, a neutral solution is not obtained at the equivalence point.
50. Atomic oxygen is an essential factor for the formation of ozone in the atmosphere.

CaO is used to regenerate $\mathrm{NH}_{3}$ in the Solvay process.

Diazonium ions can react as electrophiles.
$\mathrm{NH}_{4}^{+}$reacts with water forming $\mathrm{H}_{3} \mathrm{O}^{+}$.

Atomic oxygen in the atmosphere is produced only by decomposition of molecular oxygen.

＠（రి＠ఇణ్మ／Total Marks $01 \times 50=50$

## PART A - STRUCTURED ESSAY

Answer all four questions on this paper itself. (Each question carries $\mathbf{1 0 0}$ marks.)

1. (a) State whether the following statements are true or false on the dotted lines. Reasons are not required.
(i) Rules related to polarizing power of cations and polarizability of anions predict that the melting point of KBr is higher than that of LiI.

True

True
(ii) The electron gain energy of Be is positive.
(iii) The spacing between two adjacent lines in a given series of the atomic spectrum of hydrogen decreases gradually in the direction of decreasing wavelengths.

True
(iv) The de Broglie wavelength associated with the $\mathrm{N}_{2}$ molecule is shorter than the de Broglie wavelength of the $\mathrm{O}_{2}$ molecule when travelling at the same velocity.
(v) The effective nuclear charge $\left(\mathrm{Z}_{\text {eff }}\right)$ felt by a valence electron of C is greater than the effective nuclear charge felt by a valence electron of N .
(vi) All $\mathrm{C}-\mathrm{O}$ bonds in carbonic acid $\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right)$ are equal in length.

False

False
False

## (04 marks x $6=24$ marks)

(b) (i) Draw the most acceptable Lewis dot-dash structure for the molecule $\mathrm{Cl}_{2} \mathrm{O}_{4}$. Its skeleton is given below.

(ii) Give the oxidation states of the two chlorine atoms in the structure drawn in (i) above. The chlorine atoms are labelled as follows.

(iii) The most stable Lewis dot-dash structure for the ion $\mathrm{N}_{2} \mathrm{O}_{2}^{2-}$ is shown below. Draw two additional Lewis dot-dash structures (resonance structures) for this ion.

(iv) Complete the given table based on the Lewis dot-dash structure and its labelled skeleton given below.

|  |  |  |  | $\mathrm{C}^{3}$ | $\mathrm{N}^{4}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | VSEPR pairs around the atom | 3 | 3 | 2 | 2 |
| II | electron pair geometry around the atom | trigonal planar | trigonal planar | linear | linear |
| III | shape around the atom | angular/V | trigonal planar | linear | linear |
| IV | hybridization of the atom | $\mathrm{sp}^{2}$ | sp ${ }^{2}$ | sp | sp |

- Parts (v) to (viii) are based on the Lewis dot-dash structure given in part (iv) above. Labelling of atoms is as in part (iv).
(v) Identify the atomic/hybrid orbitals involved in the formation of $\sigma$ bonds between the two atoms given below.

(vi) Identify the atomic orbitals involved in the formation of $\pi$ bonds between the two atoms given below.
I. $\mathrm{N}^{1}-\mathrm{C}^{2}$ 2p
$\quad 2 \mathrm{p}$
$\mathrm{C}^{2} \ldots \ldots \ldots$
$\mathrm{~N}^{4} \ldots 2 \mathrm{p}$
$\mathrm{N}^{4} \ldots \ldots \ldots$
(01 mark x $6=06$ marks)
(vii) State the approximate bond angles around $\mathrm{N}^{1}, \mathrm{C}^{2}, \mathrm{C}^{3}$ and $\mathrm{N}^{4}$ atoms.

$$
\mathrm{N}^{\prime}\left(118^{\circ} \pm 1\right) \quad \mathrm{C}^{2}\left(120^{\circ} \pm 1\right) \quad \mathrm{C}^{3} \quad\left(180^{\circ} \pm 1\right) \quad \mathrm{N}^{4}\left(180^{\circ} \pm 1\right)
$$

(01 mark $\times 4$ = 04 marks)
(viii) Arrange the atoms $\mathrm{N}^{1}, \mathrm{C}^{2}, \mathrm{C}^{3}$ and $\mathrm{N}^{4}$ in the increasing order of electronegativity.
$\mathrm{C}^{2}-\mathrm{C}^{3} \quad \mathrm{~N}^{1}$
$\mathrm{N}^{4} \quad$ (04)
1(b): 54 marks
(c) (i) A laser emits photons of wavelength 695 nm .
I. To which region of the electromagnetic spectrum do these photons belong?

Visible region
(02)
II. Calculate the energy of a mole of these photons in $\mathrm{kJ} \mathrm{mol}^{-1}$.

Velocity of light $c=3.00 \times 10^{8} \mathrm{~m} \mathrm{~s}^{-1} \quad$ Planck constant $h=6.63 \times 10^{-34} \mathrm{~J} \mathrm{~s}$
Energy of a photon (E) $\quad=h \nu$

$$
\begin{equation*}
=\mathrm{h} \underline{\mathrm{c}} \tag{01}
\end{equation*}
$$

Energy of a mole of photons $=\mathrm{h} \underline{\mathrm{c}} \times \mathrm{N}_{\mathrm{A}}$
( $\mathrm{N}_{\mathrm{A}}=$ Avogadro constant)
Therefore, Energy of a mole of photons
$=\frac{6.63 \times 10^{-34}(\mathrm{~J} \mathrm{~s}) \times 3.00 \times 10^{8}\left(\mathrm{~m} \mathrm{~s}^{-1}\right) \times 6.022 \times 10^{23}\left(\mathrm{~mol}^{-1}\right)}{695 \times 10^{-9}(\mathrm{~m})}$

$$
\begin{equation*}
=172 \mathrm{~kJ} \mathrm{~mol}^{-1} \tag{02}
\end{equation*}
$$

Note: Marks can be awarded for combining steps.

$$
\mathrm{h}=6.626 \times 10^{-34}(\mathrm{~J} \mathrm{~s}) \text { is accepted. }
$$

(ii) A molecule of formula $\mathrm{AX}_{3}$ has three $\mathrm{A}-\mathrm{X} \sigma$ bonds. Here, A and X represent symbols of elements and A is the central atom.
Name the molecular shape(s) possible for $\mathrm{AX}_{3}$ in I and II given below.
I. if $\mathrm{AX}_{3}$ is polar $\quad$ T shape, $\quad$ trigonal pyramidal $\quad(02+\mathbf{0 2})$
II. if $\mathrm{AX}_{3}$ is non-polar
III. Give one example each, for the shapes stated by you in I and II above.
(Note: Molecular formulae are required.)

1(c): 22 marks
2. The questions $[(a)-(d)]$ given below relate to elements/species designated as $\mathbf{A}, \mathbf{B}, \mathbf{C}$ and $\mathbf{D}$.
(a) $\mathbf{A}$ is a $s$-block element. It has an atomic number less than 20 . It reacts with water vigorously with ignition to give a strongly basic solution, with the evolution of a gas. A reacts with excess $\mathrm{O}_{2}(\mathrm{~g})$ to give the superoxide. The naturally occurring ore Sylvite contains a compound of $\mathbf{A}$.
(i) Write the chemical symbol of $\mathbf{A}$. .................................
(ii) Write the complete electronic configuration of A. $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 4 s^{1}$
(iii) Name the gas evolved in the reaction of $A$ with water Hydrogen or $\mathrm{H}_{2}$ (05)
(iv) What is the colour given by $\mathbf{A}$ in the flame test? ........ilac (violet).
(v) Write the balanced chemical equation for the reaction of $\mathbf{A}$ with excess $\mathrm{O}_{2}(\mathrm{~g})$.

$$
\begin{equation*}
\mathrm{K}+\mathrm{O}_{2} \rightarrow \mathrm{KO}_{2} \tag{05}
\end{equation*}
$$

(vi) Is the first ionization energy of $\mathbf{A}$ higher or lower than that of the element in the same group and the period above it in the Periodic Table? Briefly explain your answer. Lower
(02)
....When going down the group. change in effective nuclear charge
(or $Z_{\text {eff }}$ ) for the outer most / last electron is negligible.
(01)
....However, atom size increases.
Therefore, attraction of outer electron to nucleus decreases. (01)
(vii) Give the chemical formula of the compound of $\mathbf{A}$ in Sylvite. .....K.CI.
(05)

Note: (vi) Award marks for reasoning only if 'lower' is written.
(b) $\mathbf{B}$ is an anion containing only the two elements $\mathbf{X}$ and $\mathbf{Y}$, in the ratio 2:3 respectively. Both $\mathbf{X}$ and $\mathbf{Y}$ are $p$-block elements that belong to the same group in the Periodic Table. The atomic number of each element is less than 20 . The electronegativity of $\mathbf{X}$ is less than the electronegativity of $\mathbf{Y}$. When $\mathbf{X}$ reacts with hot concentrated sulfuric acid, a colourless gas with a pungent smell is evolved as one of the products.
(i) Write the chemical formula, including the charge, of $\mathbf{B} . \mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$
(ii) Draw the Lewis dot-dash structure of $\mathbf{B}$.

(iii) Give the oxidation state of the central atom of B. ......+4.
(iv) Give a chemical test to identify $\mathbf{B}$. (Note: Observation(s) is/are also required.)

Test Observation

1. Add dil. $\mathrm{H}_{2} \mathrm{SO}_{4}$
2. Add $\mathrm{Pb}(\mathrm{OAc})_{2}$
3. Add $\mathrm{AgNO}_{3}$

Any one of the above. Test (02), Observation (03)

Note: Test must be correct to award marks for observation.
(v) Write the chemical formula for the compound which has $\mathbf{A}$ as the cation and $\mathbf{B}$ as the anion.
$\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$
2(b): 25 marks
(c) $\mathbf{C}$ is an oxidizing agent. It is composed of three elements in the ratio $1: 1: 3$. One of the elements of $\mathbf{C}$ is $\mathbf{A}$. The other two elements belong to the $p$-block of the Periodic Table. One of these two elements is also present in $\mathbf{B}$. The salt formed between $\mathrm{Ag}^{+}$and the anion of one of these elements is yellow in colour, and insoluble in concentrated solution. Write the chemical formula of C . $\mathrm{KIO}_{3}$
(10)

2(c): 10 marks
(d) $\mathbf{D}$ is a compound composed of two elements. Both these elements are also present in $\mathbf{C}$.
(i) When $\mathbf{C}(\mathrm{aq})$ is mixed with an excess of $\mathbf{D}(\mathrm{aq})$ in acidic medium, a reddish-brown solution results.

$$
\text { I. Identify } \mathrm{D} . \ldots \mathrm{D}=\mathrm{KI}
$$

II. Write the balanced ionic equation for the reaction that takes place.

$$
\begin{equation*}
\mathrm{IO}_{3}^{-}+5 \mathrm{I}^{-}+6 \mathrm{H}^{+} \longrightarrow 3 \mathrm{I}_{2}+3 \mathrm{H}_{2} \mathrm{O} \tag{10}
\end{equation*}
$$

(ii) On addition of an excess of a solution containing $\mathbf{B}$, to the reddish-brown solution obtained in (i) above, the reddish-brown solution becomes colourless. Write the balanced ionic equation for the reaction that takes place.

$$
\begin{equation*}
\mathrm{I}_{2}+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-} \longrightarrow \mathrm{S}_{4} \mathrm{O}_{6}^{2-}+2 \mathrm{I}^{-} \tag{05}
\end{equation*}
$$

(iii) The concentration of a solution containing $\mathbf{B}$ can be determined by volumetric analysis utilizing the reactions in (i) and (ii) above. State an indicator which can be used and give the expected colour change at the end point.
Indicator
Indicator - starch
Colour change :Colour change - blue / dark blue/ blue-violet to colourless
2(d): 30 marks
3. (a) $\mathbf{X}$ and $\mathbf{Y}$ are two volatile liquids that form an ideal solution. The temperature-composition phase diagram (at a pressure of $1.0 \times 10^{5} \mathrm{~Pa}$ ) for a system containing $\mathbf{X}$ and $\mathbf{Y}$ is given below.

Temperature ${ }^{\circ} \mathrm{C}$

- Parts (i) to (v) are based on the given phase diagram.
(i) Indicate the following regions on the phase diagram by writing the letters $\mathrm{P}, \mathrm{Q}, \mathrm{R}$.

P - region where only the liquid phase is present
$Q$ - region where only the vapour phase is present
R - region where the liquid phase and the vapour phase are in equilibrium
(ii) Give the boiling points of pure $\mathbf{X}$ and pure $\mathbf{Y}$.

Composition (X, mol\%)

$$
\mathrm{x}=60^{\circ} \mathrm{C}
$$

$$
Y=120^{\circ} \mathrm{C}
$$

(02+01) $\times 2$
(iii) What is the temperature at which a liquid mixture of $\mathbf{X}$ and $\mathbf{Y}$ containing $40 \mathrm{~mol} \%$ of $\mathbf{X}$ begins to boil?

$$
80^{\circ} \mathrm{C}
$$

(02+01)
(iv) What is the lowest temperature at which a mixture of $\mathbf{X}$ and $\mathbf{Y}$ containing $60 \mathrm{~mol} \%$ of $\mathbf{X}$ is completely converted to vapour?

$$
100^{\circ} \mathrm{C}
$$

(02+01)
(v) Calculate the saturated vapour pressure of $\mathbf{X}$ at the temperature of $100^{\circ} \mathrm{C}$.

$$
\begin{align*}
& P_{X}^{g}=P_{X}^{0} x_{X}^{l}  \tag{03}\\
& P_{X}^{g}=P^{\text {total }} x_{X}^{g}  \tag{03}\\
& \text { Therefore, } P_{X}^{0}=\frac{P^{\text {total }} x_{X}^{g}}{x_{X}^{l}}  \tag{03}\\
& P_{X}^{0}=\frac{1 \times 10^{5} P a \times 60}{15}  \tag{05+01}\\
& P_{X}^{0}=4.0 \times 10^{5} \mathrm{~Pa} \tag{04+01}
\end{align*}
$$

(vi) In a separate experiment, a mixture containing $\mathbf{X}$ and $\mathbf{Y}$ was allowed to reach equilibrium in a closed rigid container at temperature T. It was then found that the liquid phase in equilibrium with the vapour phase contained 0.10 mol of $\mathbf{X}$ and 0.10 mol of $\mathbf{Y}$. Saturated vapour pressures of $\mathbf{X}$ and $\mathbf{Y}$ at this temperature are $4.0 \times 10^{5} \mathrm{~Pa}$ and $2.0 \times 10^{5} \mathrm{~Pa}$, respectively. Using Raoult law, calculate the partial pressures of $\mathbf{X}$ and $\mathbf{Y}$.

$$
\begin{align*}
& P_{X}=\frac{0.1 \mathrm{~mol} \times 4.0 \times 10^{5} \mathrm{~Pa}}{0.1 \mathrm{~mol}+0.1 \mathrm{~mol}}  \tag{02+01}\\
& P_{X}=2.0 \times 10^{5} \mathrm{~Pa}  \tag{02+01}\\
& P_{Y}=\frac{0.1 \mathrm{~mol} \times 2.0 \times 10^{5} \mathrm{~Pa}}{0.1 \mathrm{~mol}+0.1 \mathrm{~mol}}  \tag{02+01}\\
& P_{X}=1.0 \times 10^{5} \mathrm{~Pa} \tag{02+01}
\end{align*}
$$

## 3(a): 50 marks

(b) The concentration of an aqueous solution of acetic acid (solution $\mathbf{Z}$ ) was determined by titrating with an aqueous solution of NaOH . A volume of $12.50 \mathrm{~cm}^{3}$ of solution $\mathbf{Z}$ required $25.00 \mathrm{~cm}^{3}$ of NaOH solution of concentration $0.050 \mathrm{~mol} \mathrm{dm}^{-3}$ to reach the end point.
(i) Calculate the concentration of acetic acid in solution $\mathbf{Z}$.

$$
\begin{align*}
{\left[\mathrm{CH}_{3} \mathrm{COOH}(a q)\right] } & =\frac{25.00 \mathrm{~cm}^{3} \times 0.05 \mathrm{~mol} \mathrm{dm}^{-3}}{12.50 \mathrm{~cm}^{3}}  \tag{02+01}\\
& =0.10 \mathrm{~mol} \mathrm{dm}
\end{align*}
$$

(02+01)
(ii) Calculate the pH value of solution $\mathbf{Z}$. Acid dissociation constant of acetic acid $\left(K_{\mathrm{a}}\right)$ at the temperature at which the experiment was carried out is $1.80 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$.

$$
\begin{equation*}
\mathrm{CH}_{3} \mathrm{COOH}(a q) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}(a q)+\mathrm{H}^{+}(a q) \tag{02}
\end{equation*}
$$

Or

$$
\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}(a q)+\mathrm{H}_{3} \mathrm{O}^{+}(a q)
$$

Initial concentration of acetic acid $=\mathrm{C}$
Fraction dissociated $=\alpha$ (or amount dissociated $=x$ )
[Physical states are required for $K_{a}$ ]
$K_{a}=\frac{\left[\mathrm{H}^{+}(a q)\right]\left[\mathrm{CH}_{3} \mathrm{COO}^{-}(a q)\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}(a q)\right]}$ or $K_{a}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}(a q)\right]\left[\mathrm{CH}_{3} \mathrm{COO}^{-}(a q)\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}(a q)\right]}$
$K_{a}=\frac{C \alpha C \alpha}{} \quad$ or $\quad K_{a}=\underline{x^{2}}$
[if the equation, $K_{a}=\frac{C \alpha C \alpha}{C(1-\alpha)}$ or $K_{a}=\frac{x^{2}}{C-x}$ is not written but the calculation is done correctly, award 02 marks for the calculation]

Since $\alpha \ll 1$ or $x \ll c$
pH calculation
(Do not deduct marks if physical states are not given)

$$
\begin{align*}
& {\left[H^{+}(a q)\right]=\sqrt{K_{a} \mathrm{C}}} \\
& {\left[H^{+}(a q)\right]=\sqrt{1.80 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3} \times 0.1 \mathrm{~mol} \mathrm{dm}}{ }^{-3}}  \tag{02}\\
& {\left[H^{+}(a q)\right]=0.00134 \mathrm{~mol} \mathrm{dm}}  \tag{02}\\
& p H=-\log \left[\frac{H_{3} 0^{+}(a q)}{1.0 \mathrm{~mol} \mathrm{dm}^{-3}}\right] \text { or } p H=-\log \left[\frac{\mathrm{H}^{+}(a q)}{1.0 \mathrm{~mol} \mathrm{dm}^{-3}}\right]  \tag{02}\\
& p H=2.87 \tag{02}
\end{align*}
$$

Alternate answer for pH calculation
Using Henderson equation,
(Do not deduct marks if physical states are not given)
$-\log \left[H^{+}(a q)\right]=1 / 2\left(-\log \left(K_{a} c\right)\right)$
$p H=1 / 2\left(-\log \left(1.8 \times 10^{-5} \times 0.1\right)\right.$
$p H=2.87$
(iii) To another portion $\left(100.00 \mathrm{~cm}^{3}\right)$ of solution $\mathbf{Z}, 0.200 \mathrm{~g}$ of pure solid NaOH was added and dissolved. Calculate the pH value of this solution assuming that the volume and the temperature of the solution remain unchanged.
[Relative atomic mass: $\mathrm{Na}=23, \mathrm{O}=16, \mathrm{H}=1$ ]
Amount of $\mathrm{CH}_{3} \mathrm{COOH}$ in $100.00 \mathrm{~cm}^{3}$ of solution $=1.0 \times 10^{-2} \mathrm{~mol}$
Amount of NaOH added $=0.005 \mathrm{~mol}$
Amount of $\mathrm{CH}_{3} \mathrm{COOH}$ left in the medium (after reacting with NaOH ) $=5.00 \times 10^{-3} \mathrm{~mol}$
Therefore, in solution,
(Do not deduct marks if physical states are not given)
$\left[\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})\right]=0.05 \mathrm{~mol} \mathrm{dm}^{-3}$
$\left[\mathrm{CH}_{3} \mathrm{COONa}(\mathrm{aq})\right]=0.05 \mathrm{~mol} \mathrm{dm}^{-3}$
pH calculation
(Do not deduct marks if physical states are not given)

$$
\begin{align*}
& {\left[H^{+}(a q)\right]=\frac{K_{a}\left[C H_{3} \mathrm{COOH}(a q)\right]}{\left[C \mathrm{CH}_{3} \mathrm{COO}(a q)\right]}}  \tag{02}\\
& {\left[H^{+}(a q)\right]=\frac{1.80 \times 10^{5} \mathrm{~mol} \mathrm{dm}^{-3} \times 0.050 \mathrm{~mol} \mathrm{dm}^{-3}}{0.050 \mathrm{~mol} \mathrm{dm}^{-3}}}  \tag{02}\\
& {\left[H^{+}(a q)\right]=1.80 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}} \\
& p H=4.74 \tag{02}
\end{align*}
$$

```
Alternate answer for pH calculation
(Do not deduct marks if physical states are not given)
\(p H=p K_{a}+\log \left[\frac{\left[\mathrm{CH}_{3} \mathrm{COO}^{-}(a q)\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}(a q)\right]}\right.\)
\(p H=-\log \left(1.8 \times 10^{-5}\right)+\log \left[\frac{[0.05]}{[0.05]}\right.\)
\(p H=4.74\)
```

(iv) Does the solution described in (iii) above behave as a buffer solution? Explain your answer.
The solution in (iii) above behaves as a buffer solution.
The solution contains a weak acid and the sodium salt of its conjugate base
(v) In a separate experiment, 0.800 g of pure solid NaOH was dissolved in a $100.00 \mathrm{~cm}^{3}$ volume of solution $\mathbf{Z}$. Does this solution behave as a buffer solution? Explain your answer using a suitable calculation. Assume that the volume and temperature of the solution remain unchanged.

The amount of $\mathrm{CH}_{3} \mathrm{COOH}$ in $100.00 \mathrm{~cm}^{3}=0.01 \mathrm{~mol}$
The amount of NaOH added $=0.02 \mathrm{~mol}$
Solution does not contain $\mathrm{CH}_{3} \mathrm{COOH}$ (or $\mathrm{CH}_{3} \mathrm{COOH}$ has reacted completely)
Solution does not behave as a buffer solution
3(b): 50 marks
4. (a) $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ are structural isomers having the molecular formula $\mathrm{C}_{5} \mathrm{H}_{11} \mathrm{Br}$. Of these three isomers, only $\mathbf{B}$ exhibits optical isomerism. A and $\mathbf{C}$ are positional isomers of each other. When $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ were reacted separately with aqueous NaOH , compounds $\mathbf{D}, \mathbf{E}$ and F having the molecular formula $\mathrm{C}_{5} \mathrm{H}_{12} \mathrm{O}$ were formed respectively. $\mathbf{D}, \mathrm{E}$ and $\mathbf{F}$ were treated separately with PCC. F did not react with PCC. D and E reacted with PCC and gave $\mathbf{G}$ and $\mathbf{H}$ respectively. Both compounds $\mathbf{G}$ and $\mathbf{H}$ gave coloured precipitates with 2,4 -dinitrophenylhydrazine ( $2,4-\mathrm{DNP}$ ) and silver mirrors with ammonical $\mathrm{AgNO}_{3}$.
Draw the structures of $\mathbf{A}, \mathbf{B}, \mathbf{C}, \mathbf{D}, \mathbf{E}, \mathbf{F}, \mathbf{G}$ and $\mathbf{H}$ in the boxes given below.

A

E

B

4(a): $07 \times 8=56$
(b) Draw the structures of the products $\mathbf{I}, \mathbf{J}, \mathbf{K}$ and $\mathbf{L}$ of the following reactions, in the given boxes.
(i) $\mathrm{CH}_{3} \stackrel{\mathrm{COCH}}{3}^{\mathrm{C}}$
(1) $\mathrm{CH}_{3} \mathrm{MgBr}$ (excess)/dry ether
(2) $\mathrm{H}^{+} / \mathrm{H}_{2} \mathrm{O}$
(ii) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{C} \equiv \mathrm{CH} \quad$ dilute $\mathrm{H}_{2} \mathrm{SO}_{4} / \mathrm{Hg}^{2+}$

4(b): $06 \times 4=24$ marks
(c) Give the mechanism and the structure of the product formed for the reaction between $\mathrm{CH}_{3} \mathrm{CH}=\mathrm{CHCH}_{3}$ and $\mathrm{Br}_{2} / \mathrm{CCl}_{4}$.

02 For the polarization of Br

$$
\text { 4(c): } 20 \text { marks }
$$

## PART B - ESSAY <br> Answer two questions only. (Each question carries 150 marks.)

5. (a) (i) A gas mixture containing $\mathrm{CH}_{4}, \mathrm{C}_{2} \mathrm{H}_{6}$ and excess $\mathrm{O}_{2}$ was introduced into an evacuated closed rigid container. The volume of the container was $8.314 \times 10^{-3} \mathrm{~m}^{3}$. The pressure of the container at 400 K was $4.80 \times 10^{6} \mathrm{~Pa}$. Calculate the total number of moles of gases in the container. Assume that all the gases behave ideally and that there is no reaction at this temperature.
Using $\mathrm{pV}=\mathrm{nRT}$,
(05)

At 400K, $n_{1}=\frac{4.8 \times 10^{6} \mathrm{~Pa} 8.314 \times 10^{-3} \mathrm{~m}^{3}}{8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1} 400 \mathrm{~K}}$
$n_{1}=12.0 \mathrm{~mol}$
(ii) All the hydrocarbons in the container were completely combusted by increasing the temperature of the container to 800 K . The pressure of the container after the combustion reactions at 800 K was $1.00 \times 10^{7} \mathrm{~Pa}$. Calculate the total number of moles of gases in the container after combustion. Assume that $\mathrm{H}_{2} \mathrm{O}$ is present as a gas under these conditions.

At $800 \mathrm{~K}, n_{2}=\frac{1.0 \times 10^{7} \mathrm{~Pa} 8.314 \times 10^{-3} \mathrm{~m}^{3}}{8.314 \mathrm{Jmol}^{-1} \mathrm{~K}^{-1} 800 \mathrm{~K}}$
(04+01)
$n_{1}=12.5 \mathrm{~mol}$
(04+01)
(iii) Write balanced chemical equations (giving physical states, at 800 K ) for the combustion reactions of the gases given below.
I. $\mathrm{CH}_{4}(\mathrm{~g})$
II. $\mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})$

$$
\begin{align*}
& \mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})  \tag{05}\\
& 2 \mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})+7 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 4 \mathrm{CO}_{2}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \tag{05}
\end{align*}
$$

(iv) Only one of the two hydrocarbons above contributes to the change in the number of moles of gases before and after combustion.
Calculate the number of moles of this hydrocarbon initially introduced into the container.
Hydrocarbon that contributes to the change of the number of moles before and after the combustion is $\mathrm{C}_{2} \mathrm{H}_{6}$
No. of moles increased after combustion $=0.5 \mathrm{~mol}$ The amount of $\mathrm{C}_{2} \mathrm{H}_{6}$ introduced initially $=0.5 \mathrm{~mol} \times 2=1.0 \mathrm{~mol}$
(v) The container was then cooled to 300 K and the water was removed. Then the pressure of the container was $2.10 \times 10^{6} \mathrm{~Pa}$.
Calculate the following.
Amount (moles) of gases after removing water,
$n_{3}=\frac{2.1 \times 10^{6} \mathrm{~Pa} 8.314 \times 10^{-3} \mathrm{~m}^{3}}{8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1} 300 \mathrm{~K}}$
(04+01)
$n_{3}=7.0 \mathrm{~mol}$
(04+01)
I. Total number of moles of $\mathrm{H}_{2} \mathrm{O}$ produced

The amount of water formed $=(12.7-7.0) \mathrm{mol}=5.5 \mathrm{~mol}$
(04+01)
II. Number of moles of $\mathrm{H}_{2} \mathrm{O}$ produced from the combustion of $\mathrm{C}_{2} \mathrm{H}_{6}$

The amount of water generated from the combustion of $\mathrm{C}_{2} \mathrm{H}_{6}=\frac{6.0 \mathrm{~mol} \times 3.0 \mathrm{~mol}}{2.0 \mathrm{~mol}}$

$$
=3.0 \mathrm{~mol} \quad(\mathbf{0 4 + 0 1})
$$

III. Number of moles of $\mathrm{H}_{2} \mathrm{O}$ produced from the combustion of $\mathrm{CH}_{4}$

The amount of water generated from the combustion of $\mathrm{CH}_{4}=(5.5-3.0) \mathrm{mol}$

$$
=2.5 \mathrm{~mol} \quad(04+01)
$$

IV. Number of moles of $\mathrm{O}_{2}$ introduced initially into the container

The amount of $\mathrm{O}_{2}$ introduced initially $=12.0 \mathrm{~mol}-\left(1.0 \mathrm{~mol}+\right.$ amount of $\mathrm{CH}_{4}$ introduced $)$

$$
=12.0 \mathrm{~mol}-(1.0+2.5 / 2) \mathrm{mol}
$$

$$
=9.75 \mathrm{~mol}
$$

(04+01)

## 5(a): 75 marks

Alternate answer for (iv) and (v)
(iv) Hydrocarbon that contributes to the change of the number of moles before and after the combustion is $\mathrm{C}_{2} \mathrm{H}_{6}$.
(05)

Let the number of moles of the species as follows
Initially,
$\mathrm{CH}_{4}=\mathrm{n}_{1} \quad \mathrm{C}_{2} \mathrm{H}_{6}=\mathrm{n}_{2}$ and $\mathrm{O}_{2}=2 \mathrm{n}_{1}+7 / 2 \mathrm{n}_{2}+\mathrm{n}_{\text {excess }}$
After combustion,
$\mathrm{CO}_{2}=\mathrm{n}_{1}+2 \mathrm{n}_{2}, \mathrm{H}_{2} \mathrm{O}=2 \mathrm{n}_{1}+3 \mathrm{n}_{2}$ and $\mathrm{O}_{2}=2 \mathrm{n}_{1}+7 / 2 \mathrm{n}_{2}+\mathrm{n}_{\text {excess }}$
Before combustion the number of moles in the container $\Rightarrow 12.0 \mathrm{~mol}=n_{1}+n_{2}+2 n_{1}+7 / 2 n_{2}+n_{\text {excess }}--(1)$
After combustion the number of moles in the container $\Rightarrow 12.5 \mathrm{~mol}=\mathrm{n}_{1}+2 \mathrm{n}_{2}+2 \mathrm{n}_{1}+3 \mathrm{n}_{2}+\mathrm{n}_{\text {excess }}-(2)$
(2)-(1) $=>0.5=1 / 2 n_{2}$

Amount of $\mathrm{C}_{2} \mathrm{H}_{6}$ introduced $=\mathrm{n}_{2}=1.0 \mathrm{~mol}$
(04+01)
(v) The total amount of water formed $=2 n_{1}+3 n_{2}$

Amount (moles) of gases after removing water,
$n_{1}+2 n_{2}+n_{\text {excess }}=\frac{2.1 \times 10^{6} \mathrm{~Pa} 8.314 \times 10^{-3} \mathrm{~m}^{3}}{8.314 \mathrm{Jmol}^{-1} \mathrm{~K}^{-1} 300 \mathrm{~K}}$
$n_{1}+2 n_{2}+n_{\text {excess }}=7.0 \mathrm{~mol}$
Therefore, from part (iv) equation (2),
$\mathrm{n}_{1}=1 / 2\left(12.5-\left(\mathrm{n}_{1}+2 \mathrm{n}_{2}+3 \mathrm{n}_{2}+\mathrm{n}_{\text {excess }}\right)\right)=1 / 2(12.5-10.0) \mathrm{mol}=1.25 \mathrm{~mol}$
(I) The total amount of water formed $=2 n_{1}+3 n_{2}=(2 \times 1.25+3 \times 1.0) \mathrm{mol}=5.5 \mathrm{~mol}$
(II) The amount of water formed from $\mathrm{C}_{2} \mathrm{H}_{6}$ combustion $=3 \mathrm{n}_{2}=3.0 \mathrm{~mol}$
(III) The amount of water formed from $\mathrm{CH}_{4}$ combustion $=2 \mathrm{n}_{1}=2.5 \mathrm{~mol}$
(IV) The amount of $\mathrm{O}_{2}$ introduced initially $=(12.0-(1.25+1.0)) \mathrm{mol}=9.75 \mathrm{~mol}$
(b) (i) Using a thermochemical cycle and the data given, calculate the standard enthalpy change for the reaction given below.

| $4 \mathrm{CH}_{4}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ |  |  |
| :--- | :---: | :---: |
|  | $\left(\Delta H_{f}^{\circ}\right)\left(\mathrm{kJ} \mathrm{mol}^{-1}\right)$ | $S^{\circ}\left(\mathrm{J} \mathrm{mol}^{-1} \mathrm{~K}^{-1}\right)$ |
| $\mathrm{CH}_{4}(\mathrm{~g})$ | -74.8 | 186.3 |
| $\mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})$ | -84.7 | 229.6 |
| $\mathrm{CO}_{2}(\mathrm{~g})$ | -393.5 | 213.7 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | -214.8 | 188.8 |
| $\mathrm{C}(\mathrm{s})$, graphite | 0.0 | 5.7 |
| $\mathrm{O}_{2}(\mathrm{~g})$ | 0.0 | 205.1 |
| $\mathrm{H}_{2}(\mathrm{~g})$ | 0.0 | 130.7 |

For the thermochemical cycle:
For the correct species, correct stoichiometry and correct physical state
(02 marks x $7=14$ )
$\Delta H^{0}{ }_{2}=\Delta H^{0}{ }_{1}-\Delta H^{0}{ }_{3}$
Or
$\Delta H_{2}^{0}=\sum \Delta H^{0}($ products $)-\sum \Delta H^{0}($ reactants $)$
(06)
(06)
(06)
(02)
$\Delta H_{2}^{0}=[-84.7 \times 2-214.8 \times 2-(-74.8 \times 4)] \mathrm{kJ} \mathrm{mol}^{-1}$

$$
\begin{equation*}
=-299.8 \mathrm{~kJ} \mathrm{~mol}^{-1} \tag{03+01}
\end{equation*}
$$

Alternate thermodynamic cycle

$$
4 \mathrm{CH}_{4}(\mathrm{~g})+\underset{\mathrm{O}_{2}(\mathrm{~g})}{\Delta \mathrm{H}_{1}^{\circ}} 4 \mathrm{CO}_{2}(\mathrm{~g})+8 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

(02 marks $\mathrm{x} 7=14$ )
(02)
(02)
(02)
(02)
$\Delta H^{0}{ }_{1}=(-393.5 \times 4-214.8 \times 8-(-74.8 \times 4+0 \times 8)) \mathrm{kJ} \mathrm{mol}^{-1}$ $=-2993.2 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(02) (02) (02) (02) (02)

$$
\begin{align*}
\Delta \mathrm{H}^{0_{3}} & =((-393.5 \times 4-214.8 \times 8)-(-84.7 \times 2-214.8 \times 2-0 \times 7)) \mathrm{kJ} \mathrm{~mol}^{-1} \\
& =-2693.4 \mathrm{~kJ} \mathrm{~mol}^{-1} \\
\Delta \mathrm{H}^{0}{ }_{2} & =\Delta \mathrm{H}_{1}{ }_{1}-\Delta \mathrm{H}_{3}^{0}  \tag{03}\\
& =(-2993.2-(-2693.4)) \mathrm{kJ} \mathrm{~mol} \\
& =-299.8 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{align*}
$$

(ii) Calculate the standard entropy change for the reaction in (b)(i) above.
$\Delta S^{0}=\sum S^{0}($ products $)-\sum S^{0}($ reactants $)$
(02) (02)
(02) (02)
(01)
$\begin{aligned} \Delta \mathrm{S}^{0}= & \left((229.6 \times 2+188.8 \times 2-(186.2 \times 4+205.1 \times 1)) \mathrm{J} \mathrm{mol}^{-1} \mathrm{~K}^{-1}\right. \\ & =-113.5 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\end{aligned}$
(02+01)
(iii) Calculate the standard Gibbs energy change $\left(\Delta G^{\circ}\right)$ for the reaction in (b)(i) above at 500 K .

$$
\begin{align*}
\Delta \mathrm{G}^{0} & =\Delta \mathrm{H}^{0}-\mathrm{T} \Delta \mathrm{~S}^{0}  \tag{04}\\
& =-299.8 \mathrm{~kJ} \mathrm{~mol}^{-1}-\left(500 \mathrm{~K} \times\left(-113.5 \times 10^{-3}\right) \mathrm{kJ} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right) \\
& =-243.05 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{align*}
$$

(iv) State, giving reasons, whether increase in temperature favours the reaction in (b)(i) above. Assume that the enthalpy change and entropy change are independent of temperature.

Increasing temperature does not favour the forward reaction.
(03)
(Or increasing temperature makes Gibbs energy change less negative)
Because the reaction has a negative change in entropy.
[If the sign of entropy change is incorrect, but prediction agrees with the sign of the entropy change award 06 marks)

5(b) : 75 marks
6. (a) (i) Consider the reversible reaction $\mathbf{a} \mathbf{A}(\mathbf{a q}) \rightleftharpoons \mathbf{b} \mathbf{B}(\mathbf{a q})+\mathbf{c} \mathbf{C}(\mathbf{a q})$ that occurs in the aqueous medium. Considering that both forward and reverse steps are elementary reactions, write expressions for the rate of the forward reaction $\left(\mathrm{R}_{1}\right)$ and the rate of the reverse reaction $\left(\mathrm{R}_{2}\right)$. Rate constants for the forward reaction and the reverse reaction are $k_{1}$ and $k_{2}$, respectively.
$\mathrm{R}_{1}=\mathrm{k}_{1}[\mathrm{~A}(\mathrm{aq})]^{\mathrm{a}}$
(05+01)
$R=k[B(a q)]^{b}[C(a q)]^{c}$
(05+01)
(ii) Write the relationship between $\mathrm{R}_{1}$ and $\mathrm{R}_{2}$ at equilibrium.

At equilibrium, $\mathrm{R}_{1}=\mathrm{R}_{2}$
(iii) Write down the expression for equilibrium constant $K_{\mathrm{C}}$. Also give the relationship between $K_{\mathrm{C}}, k_{1}$ and $k_{2}$.

$$
K_{c}=\frac{[B(a q)]^{b}[C(a q)]^{c}}{[A(a q)]^{a}}
$$

(05+01)

## [expression 05 marks, physical states 01 mark]

$$
\begin{equation*}
K_{C}=\frac{k_{1}}{k_{2}} \tag{05}
\end{equation*}
$$

(iv) To study the above equilibrium, three experiments were carried out at a constant temperature. In these experiments, different amounts of $\mathrm{A}, \mathrm{B}$ and C were mixed, and the system was allowed to reach equilibrium. The following data were obtained at equilibrium.

| Experiment <br> Number | Concentration at equilibrium $\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$ |  |  |
| :---: | :---: | :---: | :---: |
|  | $[\mathrm{A}]$ | $[\mathrm{B}]$ | $[\mathrm{C}]$ |
| 1 | $1.0 \times 10^{-1}$ | $1.0 \times 10^{-2}$ | $1.0 \times 10^{-3}$ |
| 2 | $1.0 \times 10^{-2}$ | $1.0 \times 10^{-3}$ | $1.0 \times 10^{-3}$ |
| 3 | $1.0 \times 10^{-2}$ | $1.0 \times 10^{-2}$ | $1.0 \times 10^{-5}$ |

1. Obtain three relationships by substituting the concentrations of $\mathrm{A}, \mathrm{B}$ and C given in the table for experiments 1,2 and 3 in the equilibrium constant expression written in (a)(iii) above.

$$
\begin{align*}
& K_{c}=\frac{\left(1.0 \times 10^{-2}\right)^{b}\left(1.0 \times 10^{-3}\right)^{c}}{\left(1.0 \times 10^{-1}\right)^{a}}  \tag{06}\\
& K_{C}=\frac{\left(1.0 \times 10^{-3}\right)^{b}\left(1.0 \times 10^{-3}\right)^{c}}{\left(1.0 \times 10^{-2}\right)^{a}}  \tag{06}\\
& K_{C}=\frac{\left(1.0 \times 10^{-2}\right)^{b}\left(1.0 \times 10^{-5}\right)^{c}}{\left(1.0 \times 10^{-2}\right)^{a}} \tag{06}
\end{align*}
$$

II. Prove that $\mathrm{a}=\mathrm{b}=2 \mathrm{c}$ using these relationships.

From $(1) /(2)=>1=\frac{10^{b}}{10^{a}}$
$10^{a}=10^{b}$
$a=b$
From $(2) /(3)=>1=\frac{10^{2 c}}{10^{b}}$
$10^{b}=10^{2 c}$

Therefore, $\mathrm{a}=\mathrm{b}=2 \mathrm{c}$

Alternate answer 1 for (iv) (II)
Using equation (1), (2) and (3) in (iv)(I)
$K_{C}=10^{-2 b-3 c+a}$ $\qquad$
$K_{C}=10^{-3 b-3 c+2 a}$ $\qquad$
$K_{C}=10^{-2 b-5 c+2 a}$
$\log \mathrm{K}_{\mathrm{c}}=-2 \mathrm{~b}-3 \mathrm{c}+\mathrm{a}$
$\log \mathrm{K}_{\mathrm{c}}=-3 \mathrm{~b}-3 \mathrm{c}+2 \mathrm{a}$
$\log \mathrm{K}_{\mathrm{c}}=-2 \mathrm{~b}-5 \mathrm{c}+2 \mathrm{a}$
(4)/(5) or (7)-(8) $\rightarrow \mathrm{a}=\mathrm{b}$
$(5) /(6)$ or $(8)-(9) \rightarrow a=2 c$
Therefore, $\mathrm{a}=\mathrm{b}=2 \mathrm{c}$

## Alternate answer 2 for (iv) (II)

Using equation (1), (2) and (3) in (iv)(I)

$$
\begin{align*}
& K_{C}=(0.01)^{b}(0.001)^{c}(0.1)^{-a}-\ldots------  \tag{4}\\
& K_{C}=(0.001)^{b}(0.001)^{c}(0.01)^{-a}-\ldots---- \\
& K_{C}=(0.01)^{b}(0.00001)^{c}(0.01)^{-a}-\ldots---
\end{align*}
$$

$(1) /(2) \rightarrow \quad 1=10^{b} \times 10^{-a}$

$$
\begin{gathered}
10^{a}=10^{b} \\
a=b
\end{gathered}
$$

$(1) /(3) \rightarrow \quad 1=10^{2 c} \times 10^{-a}$

$$
a=2 c
$$

Therefore, $a=b=2 c$
III. Using the smallest integers for the stoichiometric coefficients $\mathrm{a}, \mathrm{b}$ and c , calculate the value of the equilibrium constant, $K_{\mathrm{C}}$ of the above reaction.

Using the smallest set of integers,
$\mathrm{a}=2, \mathrm{~b}=2, \mathrm{c}=1$
Calculation of $K_{C}$
$\left.K_{C}=\frac{\left(1.0 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}\right)^{2}\left(1.0 \times 10^{-3} \mathrm{~mol} \mathrm{dm}\right.}{}{ }^{-3}\right)^{1}{ }_{\left(1.0 \times 10^{-1} \mathrm{~mol} \mathrm{dm}^{-3}\right)^{2}}$
$K_{C}=1.0 \times 10^{-5} \mathrm{~mol} \mathrm{dm}{ }^{-3}$
$((02+01) \times 3=09)$
(04+01)
6(a) : 80 marks
(b) Consider the reaction, $\mathrm{p} \mathbf{P}(\mathrm{g}) \rightleftharpoons \mathrm{q} \mathrm{Q}(\mathrm{g})+\mathrm{r} \mathbf{R}(\mathrm{g})$ that takes place in gas phase.
(i) The enthalpy change and activation energy of the forward reaction, $p \mathbf{P}(\mathrm{~g}) \rightarrow \mathbf{q} \mathbf{Q}(\mathrm{g})+\mathbf{r} \mathbf{R}(\mathrm{g})$ are $50.0 \mathrm{~kJ} \mathrm{~mol}^{-1}$ and $90.0 \mathrm{~kJ} \mathrm{~mol}^{-1}$, respectively. Draw the labelled energy diagram (the graph of energy vs reaction coordinate) for this reaction. Show the positions of $\mathrm{P}, \mathrm{Q}$ and R by marking them on the energy diagram. Also, mark the position of the activated complex as 'activated complex' on it.

(ii) Calculate the activation energy for the reverse reaction.

Activation energy of the reaction $=E_{a}$

$$
\begin{align*}
\mathrm{E}_{\mathrm{a}} & =(90.0-50.0) \mathrm{kJ} \mathrm{~mol}^{-1}  \tag{05+01}\\
& =40.0 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{align*}
$$

(04+01]
(iii) Explain the effect of increasing temperature on the equilibrium constant of this reaction.

When the temperature is increased, the equilibrium constant is increased (05) because the reaction has a positive change in enthalpy (05)
When the temperature is increased, the rate constant of the forward reaction is increased more than the rate constant of the reverse reaction. (05)
(iv) Explain the effect of a catalyst
I. on the rates of forward and reverse reactions.
II. on the equilibrium constant.
(I) Increases the rate of forward reaction (05) and the rate of the reverse reaction (05)
by the same factor (extent). (05)
(II) The value of the equilibrium constant is not changed. (05)

## Alternate answer

(iv) Addition of a catalyst,
(I) It provides a new pathway for the reaction with higher rate constants for forward and reverse reactions (05). The ratio between the two rate constants does not change (05). Rate constants of the forward and reverse reactions are increased by the same factor (extent). (05)
(II) The value of the equilibrium constant is not changed. (05)

## 6(b) : 70 marks

7. (a) You are provided with the three metal rods $\mathbf{L}, \mathbf{M}, \mathbf{N}$ and the three solutions $\mathbf{L}^{2+}\left(1.0 \mathrm{~mol} \mathrm{dm}^{-3}\right)$, $\mathbf{M}^{2+}\left(1.0 \mathrm{~mol} \mathrm{dm}^{-3}\right), \mathbf{N}^{2+}\left(1.0 \mathrm{~mol} \mathrm{dm}{ }^{-3}\right)$. When the metal $\mathbf{N}$ is dipped in the solution of $\mathbf{M}^{2+}$ ions, $\mathbf{M}^{2+}$ is reduced to $\mathbf{M}$, whereas when $\mathbf{N}$ is dipped in the solution of $\mathbf{L}^{2+}$ ions, $\mathbf{L}^{2+}$ does not get reduced to $\mathbf{L}$.
(i) Giving reasons arrange the three metals, $\mathbf{L}, \mathbf{M}$ and $\mathbf{N}$ in the increasing order of their reducing ability.
$\mathrm{N}(\mathrm{s})+\mathrm{M}^{2+}(\mathrm{aq}) \rightarrow \mathrm{N}^{2+}(\mathrm{aq})+\mathrm{M} \quad$ is spontaneous
Reducing ability $\mathrm{N}>\mathrm{M} \quad$ or $\left[\mathrm{E}^{0}{ }_{\mathrm{N} 2+\mathrm{N}}<\mathrm{E}^{0}{ }_{\mathrm{M} 2+\mathrm{M}}\right]$
$\mathrm{N}(\mathrm{s})+\mathrm{L}^{2+}(\mathrm{aq}) \rightarrow \mathrm{N}^{2+}(\mathrm{aq})+\mathrm{L} \quad$ not spontaneous
Reducing ability of $\mathrm{L}>\mathrm{N} \quad$ or $\left[\mathrm{E}^{0} \mathrm{~L} 2+/ \mathrm{L}<\mathrm{E}^{0} \mathrm{~N} 2+\mathrm{N}\right]$
Increasing order of reducing ability $\mathrm{M}<\mathrm{N}<\mathrm{L}$
(Or increasing order of oxidizing ability $\mathrm{L}<\mathrm{N}<\mathrm{M}$ )
(ii) Electromotive forces of the two electrochemical cells prepared using $\mathbf{L}^{2+}(\mathrm{aq}) / \mathbf{L}(\mathrm{s})$ electrode and each of the other two electrodes are +0.30 V and +1.10 V . Using this information and your answer to (i) above, calculate $E_{\mathbf{M}^{2+}(\text { aq }) / \mathbf{M}(\mathrm{s})}^{\circ}$ and $E_{\mathbf{N}^{2+(a q)} / \mathbf{N}(\mathrm{s})}^{\circ}$.

$$
\left(E_{\mathbf{L}^{2+(\mathrm{aq}) / \mathbf{L}(\mathrm{s})}}^{\circ}=-0.80 \mathrm{~V}\right)
$$

Out of the two cells one has $\mathrm{E}_{\text {cell }}=0.30 \mathrm{~V}$ and the other has $\mathrm{E}_{\text {cell }}=1.10 \mathrm{~V}$
Highest $\mathrm{E}_{\text {cell }}$ is between $\mathrm{L}^{2+}(\mathrm{aq}) / \mathrm{L}$ electrode and $\mathrm{M}^{2+}(\mathrm{aq}) / \mathrm{M}$ electrode.
The lowest $\mathrm{E}_{\text {cell }}$ is between $\mathrm{L}^{2+}(\mathrm{aq}) / \mathrm{L}$ electrode and $\mathrm{N}^{2+}(\mathrm{aq}) / \mathrm{N}$ electrode.
$\mathrm{E}^{0}{ }_{\mathrm{M} 2+(\mathrm{aq}) / \mathrm{M}}-\mathrm{E}^{0}{ }_{\mathrm{L} 2+(\mathrm{aq}) / \mathrm{L}}=1.10 \mathrm{~V}$
$\mathrm{E}^{0}{ }_{\mathrm{M} 2+(\mathrm{aq}) / \mathrm{M}}=1.10 \mathrm{~V}-0.80 \mathrm{~V}=0.30 \mathrm{~V}$
And
$\mathrm{E}^{0}{ }_{\mathrm{N} 2+(\mathrm{aq}) / \mathrm{N}}-\mathrm{E}^{0}{ }_{\mathrm{L} 2+(\mathrm{aq}) / L}=0.30 \mathrm{~V}$
$\mathrm{E}^{0}{ }_{\mathrm{N} 2+(\mathrm{aq}) / \mathrm{N}}=0.30 \mathrm{~V}+(-0.80 \mathrm{~V})=-0.50 \mathrm{~V}$

## Alternate answer

Based on the order of reducing ability, $\mathrm{L}^{2+} / \mathrm{L}$ should be the anode in both the cells.
$\mathrm{E}_{\text {cathode }}^{0}-\mathrm{E}^{0}{ }_{\mathrm{L} 2+\mathrm{L}}=1.10 \mathrm{~V}$
Therefore $\mathrm{E}^{0}$ cathode $=1.10 \mathrm{~V}-0.80 \mathrm{~V}=0.3 \mathrm{~V}$
$\mathrm{E}_{\text {cathode }}^{0}-\mathrm{E}_{\mathrm{L} 2+/ \mathrm{L}}^{0}=0.3 \mathrm{~V}$
Therefore $\mathrm{E}^{0}$ cathode $=0.3 \mathrm{~V}-0.80 \mathrm{~V}=-0.5 \mathrm{~V}$
Therefore,
$\mathrm{E}^{0}{ }_{\mathrm{M} 2+\mathrm{M}}=0.3 \mathrm{~V}$
$\mathrm{E}^{0}{ }_{\mathrm{N} 2+1 / \mathrm{N}}=-0.5 \mathrm{~V}$
(iii) You are provided with the following arrangement, where a potentiometer $(\mathbf{P})$ is connected between the metal rods $\mathbf{L}$ and $\mathbf{N}$.

I. Calculate the potentiometer reading.
II. Write the electrode reactions that occur at each of the electrodes (A), (B), (C) and (D) separately when the potentiometer is removed and $\mathbf{L}$ and $\mathbf{N}$ are connected by a conductor.

Potentiometer reading ( P ),

$$
\begin{align*}
\mathrm{P} & =\mathrm{E}^{0}{ }_{\text {cell(1) }}+\mathrm{E}^{0}{ }_{\text {cell(2) }}  \tag{05}\\
& =\left(\mathrm{E}^{0}{ }_{\mathrm{M} 2+(\mathrm{aq}) / \mathrm{M}}-\mathrm{E}_{\mathrm{L} 2+(\mathrm{aq}) / \mathrm{L}}\right)+\left(\mathrm{E}^{0}{ }_{\mathrm{N} 2+(\mathrm{aq}) / \mathrm{N}}-\mathrm{E}_{\mathrm{M} 2+(\mathrm{aq}) / \mathrm{M})}^{0}\right)  \tag{05}\\
& =\mathrm{E}_{\mathrm{N} 2+(\mathrm{aq}) / \mathrm{N}}-\mathrm{E}_{\mathrm{L} 2+(\mathrm{aq}) / \mathrm{L}}  \tag{05}\\
& =-0.50 \mathrm{~V}-(-0.80 \mathrm{~V}) \\

\end{align*}
$$

II. Write the electrode reactions that occur at each of the electrodes (A), (B), (C) and (D) separately when the potentiometer is removed and $\mathbf{L}$ and $\mathbf{N}$ are connected by a conductor.

Electrode reactions when a current is drawn.
Electrode (A) L(s) $\rightarrow \mathrm{L}^{2+}(\mathrm{aq})+2 \mathrm{e}$
Electrode (B) $\quad \mathrm{M}^{2+}(\mathrm{aq})+2 \mathrm{e} \rightarrow \mathrm{M}(\mathrm{s})$

Electrode (D) $\mathrm{N}^{2+}(\mathrm{aq})+2 \mathrm{e} \rightarrow \mathrm{N}(\mathrm{s})$

$$
\text { 7(a) : } 75 \text { marks }
$$

(b) The following questions are based on the element manganese ( Mn ).
(i) Write the complete electronic configuration of Mn .
$1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 3 d^{5} 4 s^{2}$
(ii) Write three common oxidation states of Mn .

$$
+2,+3,+4, \quad+7 \quad \text { (any three) }
$$

(02 x 3)
(iii) When $\mathrm{MnSO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ is dissolved in water, solution $\mathbf{P}$ is obtained.
I. State the colour of solution $\mathbf{P}$.
II. Give the chemical formula and the IUPAC name of the species responsible for this colour.
I. very pale pink/ pale pink/ colourless
II. $\left[\mathrm{Mn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}(\mathrm{aq})$
hexaaquamanganese(II) ion
(iv) What would you observe when
I. dilute NaOH is added to solution $\mathbf{P}$ ?
II. the mixture from (iv)(I) above is exposed to air?
III. conc. HCl is added to the mixture from (iv)(I) above?
I. white/cream precipitate
II. brown precipitate or blackish-brown precipitate
III. Yellow / greenish-yellow solution
(v) Give the chemical formulae of five oxides of Mn , and write the oxidation state of Mn in each. State the nature of each of the oxides as basic, weakly basic, amphoteric, weakly acidic, acidic.

| MnO | +2 | basic | (02 x 3) |
| :---: | :---: | :---: | :---: |
| $\mathrm{Mn}_{2} \mathrm{O}_{3}$ | +3 | weakly basic | (02 x 3) |
| $\mathrm{MnO}_{2}$ | +4 | amphoteric | (02 $\times 3$ ) |
| $\mathrm{MnO}_{3}$ | +6 | weakly acidic | (02 x 3) |
| $\mathrm{Mn}_{2} \mathrm{O}_{7}$ | +7 | acidic | (02 x 3) |

(vi) Give the chemical formula of the most common oxoanion of Mn .
$\mathrm{MnO}_{4}^{-}$
(vii) Give balanced ionic half equations to indicate how the oxoanion given by you in (vi) above behaves as an oxidizing agent in acidic and basic media.

Acidic
$\mathrm{MnO}_{4}^{-}(\mathrm{aq})+8 \mathrm{H}^{+}(\mathrm{aq})+5 \mathrm{e} \longrightarrow \mathrm{Mn}^{2+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Alkaline
$\mathrm{MnO}_{4}^{-}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+3 \mathrm{e} \longrightarrow \mathrm{MnO}_{2}(\mathrm{~s})+4 \mathrm{OH}^{-}(\mathrm{aq})$
(viii) State one use of $\mathrm{MnSO}_{4}$ in the analysis of water quality parameters.

Determination of dissolved $\mathrm{O}_{2}$ in water samples

## 7(b) : 75 marks

PART C - ESSAY
Answer two questions only. (Each question carries 150 marks.)
8. (a) Compound $\mathbf{P}$ was converted to compound $\mathbf{V}$ using the reaction scheme given below.

(i) Complete the above reaction sequence by drawing the structures of compounds $\mathbf{Q}, \mathbf{R}, \mathbf{S}$, $\mathbf{T}$ and $\mathbf{U}$ and writing the reagents for steps $1-6$ selected only from those given in the list below.

List of reagents
$\mathrm{HCHO}, \mathrm{Mg} /$ dry ether, $\mathrm{H}^{+} / \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}, \mathrm{PCl}_{5}, \mathrm{PBr}_{3}, \mathrm{NaNO}_{2} /$ dilute $\mathrm{HCl}, \mathrm{H}^{+} / \mathrm{H}_{2} \mathrm{O}$
(Note: The reaction of a compound with a Grignard reagent and the hydrolysis of the resultant magnesium alkoxide should be considered as one step in the above reaction sequence.)
(i)
(ii) Draw the structure of the product formed when compounds $\mathbf{P}$ and $\mathbf{V}$ react with each other.

*In Step 4 the student may have misinterpreted the instruction given in the note in the question and written HCHO and $\mathrm{H}^{+} / \mathrm{H}_{2} \mathrm{O}$ without showing the sequence 1 and 2.

(b) (i) Propose a method to prepare a mixture of $o$-nitrobenzoic acid and $p$-nitrobenzoic acid from benzene using not more than three (03) steps.

(b)(i): $\mathbf{3 4 \text { marks }}$
(ii) Give the structure of the product $\mathbf{X}$ and the mechanism of the following reaction.

$165 \mathrm{mantr})$

(b) (ii): 31 marks

8(b): 65 marks
(c) The structure of benzene is represented as the resonance hybrid of the following two hypothetical six membered cyclic structures (cyclohexatriene).

Using the standard enthalpy data of hydrogenation given below, show that benzene is more stable than hypothetical 'cyclohexatriene'.

(c) Standard enthalpy of hydrogenation of cyclohexene $\quad=-120 \mathrm{~kJ} \mathrm{~mol}^{-1}$

| Expected enthalpy of hydrogenation of hypothetical "cyclohexatriene"" | $=\underline{-120 \times 3 \mathrm{~kJ} \mathrm{~mol}^{-1}}$ |
| ---: | :--- |
|  | $=-360 \mathrm{~kJ} \mathrm{~mol}^{-1}$ |
| Standard enthalpy of hydrogenation of benzene | $=-208 \mathrm{~kJ} \mathrm{~mol}^{-1}$ |
| Stabilization energy of benzene | $=\underline{-152 \mathrm{~kJ} \mathrm{~mol}^{-1}} 1$ |

OR

H

NB. $\mathbf{1 0}$ marks for calculating the expected enthalpy of hydrogenation of "cyclohexatriene"
$\mathbf{1 0}$ Marks for stating or indicating the stabilization of benzene. This $\mathbf{1 0}$ marks can be awarded even if the stabilization energy is not calculated but indicating by a statement such as following.

Hydrogenation of both benzene and "cyclohexatriene" (with $3 \mathrm{H}_{2}$ ) give cyclohexane. However, benzene

8(c):20 marks
9. (a) The following question is based on the qualitative analysis of cations.

An aqueous solution $\mathbf{Q}$ contains four cations of metals $\mathbf{A}, \mathbf{B}, \mathbf{C}$ and $\mathbf{D} . \mathbf{Q}$ is subjected to the reactions given in the scheme below.
The symbols given in the box are used to represent precipitates with solutions, solids and solutions.

(i) $\mathbf{A}_{1}, \mathbf{A}_{2}, \mathbf{A}_{3}, \mathbf{B}_{1}, \mathbf{B}_{2}, \mathbf{C}_{1}, \mathbf{C}_{2}$, and $\mathbf{D}_{1}$ are compounds/species of the four cations $\mathbf{A}, \mathbf{B}, \mathbf{C}$, and $\mathbf{D}$. Identify $\mathbf{A}_{1}, \mathbf{A}_{2}, \mathbf{A}_{3}, \mathbf{B}_{1}, \mathbf{B}_{2}, \mathbf{C}_{1}, \mathbf{C}_{2}$, and $\mathbf{D}_{1}$.
(Note: Write only chemical formulae. Chemical equations and reasons are not required.)

| $\mathbf{A}_{1}$ | $\mathrm{PbCl}_{2}$ |
| :--- | :--- |
| $\mathbf{A}_{\mathbf{2}}$ | $\mathrm{Pbl}_{2}$ |
| $\mathbf{A}_{\mathbf{3}}$ | PbS |
| $\mathbf{B}_{1}$ | $\mathrm{Al}(\mathrm{OH})_{3}$ |
| $\mathbf{B}_{\mathbf{2}}$ | $\mathrm{NaAlO} \mathbf{2}_{2}$ or $\mathrm{AlO}_{2}{ }^{-}$or $\left[\mathrm{Al}(\mathrm{OH})_{4}\right]^{-}$or $\mathrm{Na}\left[\mathrm{Al}(\mathrm{OH})_{4}\right]$ |
| $\mathbf{C}_{\mathbf{1}}$ | ZnS |
| $\mathbf{C}_{\mathbf{2}}$ | $\mathrm{Zn}(\mathrm{OH})_{2}$ |
| $\mathbf{D}_{\mathbf{1}}$ | SrCO |

(08 marks x $8=64$ marks)
(ii) Give a reason for the use of $\mathrm{NH}_{4} \mathrm{OH} / \mathrm{NH}_{4} \mathrm{Cl}$ as a reagent when obtaining the white gelatinous precipitate (*).
(75 marks)
$\mathrm{NH}_{4} \mathrm{OH}$ is added to precipitate the Group III ions ( $\mathrm{Fe}^{3+}, \mathrm{Al}^{3+}$ and $\mathrm{Cr}^{3+}$ ) as hydroxides.
Then, the hydroxides of Group IV metal ions $\left(\mathrm{Zn}^{2+}, \mathrm{Mn}^{2+}, \mathrm{Co}^{2+}\right.$ and $\left.\mathrm{Ni}^{2+}\right)$
may also precipitate together with the hydroxides of Group III metal ions.
$\mathrm{NH}_{4} \mathrm{Cl}$ is added to reduce the concentration of $\mathrm{OH}^{-}$(common ion effect). (02)
or
Addition of $\mathrm{NH}_{4} \mathrm{Cl}$ shifts the equilibrium position of $\mathrm{NH}_{4} \mathrm{OH}$
$\mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq}) \rightleftarrows \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$ and the concentration of
OH - is reduced
The Ksp of hydroxides of Group IV metal ions is greater than those of the Group III metal ions.
This allows $\mathrm{Fe}^{3+}, \mathrm{Al}^{13+}$ and $\mathrm{Cr}^{3+}$ hydroxides to be precipitated while the hydroxides of $\mathrm{Zn}^{2+}, \mathrm{Mn}^{2+}, \mathrm{Co}^{2+}$ and $\mathrm{Ni}^{2+}$ remain in solution.
(11 marks)
Alternate Answer
$\mathrm{NH}_{4} \mathrm{OH}$ is added to precipitate $\mathrm{Al}^{3+}$ as the hydroxide.
However, then both $\mathrm{Zn}^{2+}$ and $\mathrm{Al}^{3+}$ can be precipitated as
their hydroxides.
$\mathrm{NH}_{4} \mathrm{Cl}$ is added to reduce the concentration of $\mathrm{OH}^{-}$(common ion effect).
or
Addition of $\mathrm{NH}_{4} \mathrm{Cl}$ shifts the equilibrium position of $\mathrm{NH}_{4} \mathrm{OH}$
$\mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq}) \rightleftarrows \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$ and the concentration of
OH - is reduced
$\mathrm{K}_{\text {sp }}$ of $\mathrm{Zn}(\mathrm{OH})_{2}>\mathrm{Al}(\mathrm{OH})_{3}$
Therefore, precipitation of $\mathrm{Zn}(\mathrm{OH})_{2}$ can be prevented by using $\mathrm{NH}_{4} \mathrm{Cl} / \mathrm{NH}_{4} \mathrm{OH}$
(11 marks)
9(a): 75 marks
(b) A mixture $\mathbf{X}$ contains only aluminium sulfide $\left(\mathrm{Al}_{2} \mathrm{~S}_{3}\right)$ and ferric sulfide $\left(\mathrm{Fe}_{2} \mathrm{~S}_{3}\right)$. The following procedure was carried out to calculate the mass percentages of $\mathrm{Al}_{2} \mathrm{~S}_{3}$ and $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ in $\mathbf{X}$.
When a mass $\mathbf{m}$ of mixture $\mathbf{X}$ was heated at high temperature under $\mathrm{H}_{2}$ gas, $\mathrm{Al}_{2} \mathrm{~S}_{3}$ remains unchanged but $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ was converted to iron ( Fe ) metal. The final mass obtained was 0.824 g . When another mass $\mathbf{m}$ of mixture $\mathbf{X}$ was heated at high temperature in air, both $\mathrm{Al}_{2} \mathrm{~S}_{3}$ and $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ decomposed, giving $\mathrm{SO}_{2}$ gas. This $\mathrm{SO}_{2}$ gas was bubbled through a solution of $\mathrm{H}_{2} \mathrm{O}_{2}$ and oxidized to $\mathrm{H}_{2} \mathrm{SO}_{4}$ acid, which is the only product. When this entire solution was titrated with a standard $1.00 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NaOH}$ solution in the presence of phenolpthalein indicator, the burette reading was $36.00 \mathrm{~cm}^{3}$.
(i) Write the balanced chemical equation for the reaction of $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ with hydrogen gas.

$$
\begin{equation*}
\mathrm{Fe}_{2} \mathrm{~S}_{3}+3 \mathrm{H}_{2} \rightarrow 2 \mathrm{Fe}+3 \mathrm{H}_{2} \mathrm{~S} \tag{04}
\end{equation*}
$$

(ii) Write the balanced chemical equation for the reaction of $\mathrm{SO}_{2}$ with $\mathrm{H}_{2} \mathrm{O}_{2}$ to give $\mathrm{H}_{2} \mathrm{SO}_{4}$.

$$
\begin{equation*}
\mathrm{SO}_{2}+\mathrm{H}_{2} \mathrm{O}_{2} \rightarrow \mathrm{H}_{2} \mathrm{SO}_{4} \tag{04}
\end{equation*}
$$

(iii) Calculate the mass percentages of $\mathrm{Al}_{2} \mathrm{~S}_{3}$ and $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ in mixture X .

$$
\begin{align*}
& 2 \mathrm{Al}_{2} \mathrm{~S}_{3}+9 \mathrm{O}_{2} \rightarrow 2 \mathrm{Al}_{2} \mathrm{O}_{3}+6 \mathrm{SO}_{2} \quad \text { or } \mathrm{Al}_{2} \mathrm{~S}_{3}: \mathrm{SO}_{2}=1: 3 \\
& 2 \mathrm{Fe}_{2} \mathrm{~S}_{3}+9 \mathrm{O}_{2} \rightarrow 2 \mathrm{Fe}_{2} \mathrm{O}_{3}+6 \mathrm{SO}_{2} \text { or } \mathrm{Fe}_{2} \mathrm{~S}_{3}: \mathrm{SO}_{2}=1: 3 \\
& \mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O} \text { or } \mathrm{H}_{2} \mathrm{SO}_{4}: \mathrm{NaOH}=1: 2 \\
& \quad \text { Molar mass of } \mathrm{Al}_{2} \mathrm{~S}_{3}=(27 \times 2)+(32 \times 3)=150 \\
& \text { Molar mass of } \mathrm{Fe}_{2} \mathrm{~S}_{3}=(56 \times 2)+(32 \times 3)=218 \tag{02}
\end{align*}
$$

Assume mass of $\mathrm{Al}_{2} \mathrm{~S}_{3}$ to be $\mathrm{m}_{1}$ and $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ to be $\mathrm{m}_{2}$
Mass of Fe from $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ after heating under $\mathrm{H}_{2}$
$\frac{m_{2}}{208} \times 56 \times 2$
Total mass after heating under $\mathrm{H}_{2}$
$m_{1}+\frac{m_{2}}{208} \times 56 \times 2=0.824 \mathrm{~g} \square \quad$ [1]
(08]

From heating under air
Mols of $\mathrm{H}_{2} \mathrm{SO}_{4}$ from $\mathrm{Al}_{2} \mathrm{~S}_{3}=\frac{m_{1}}{150} \times 3$
Mols of $\mathrm{H}_{2} \mathrm{SO}_{4}$ from $\mathrm{Fe}_{2} \mathrm{~S}_{3}=\frac{m_{2}}{208} \times 3$
Total mols from both $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ and $\mathrm{Al}_{2} \mathrm{~S}_{3}=\frac{m_{1}}{150} \times 3+\frac{m_{2}}{208} \times 3$
Mols of NaOH for titration $\quad=\frac{1}{1000} \times 36$

Mols of $\mathrm{H}_{2} \mathrm{SO}_{4}$ from titration

$$
\begin{equation*}
=\frac{1}{1000} \times \frac{36}{2}=18 \times 10^{-3} \tag{02}
\end{equation*}
$$

$$
\begin{array}{ll}
\frac{3 m_{1}}{150}+\frac{3 m_{2}}{208}=18 \times 10^{-3} g & \rightarrow[2]  \tag{08}\\
m_{1}+\frac{m_{2}}{208} \times 112=0.824 \mathrm{~g} & \rightarrow[1] \\
\frac{3 m_{1}}{150}+\frac{3 m_{2}}{208}=18 \times 10^{-3} \mathrm{~g} & \rightarrow[2]
\end{array}
$$

Solving equations [1] and [2] for $m_{1}$ and $m_{2}$

$$
\begin{array}{ll}
\frac{m_{1}}{50}+\frac{3 m_{2}}{208}=0.018 & \rightarrow[3] \\
\frac{m_{1}}{50}+\frac{3 m_{2}}{208}=0.018 & \rightarrow[3]
\end{array}
$$

[3] $\times 50$
$m_{1}+\frac{150 m_{2}}{208}=50 \times 0.018 \rightarrow[4]$
[4] - [1]
$\frac{150 m_{2}}{208}-\frac{112 m_{2}}{208}=0.900 \times 0.824$
$m_{2}=0.416 \mathrm{~g}$
$m_{2}=0.416 \mathrm{~g}$ in eq [1]
$m_{1}+\frac{0.416 \times 112}{208}=0.824$
$m_{1}=0.600 \mathrm{~g}$
$\% m_{1}=\frac{0.600}{0.416+0.600} \times 100 \%=59.06 \% \quad$ or $59 \%$
$\% m_{2}=100-59.06=40.94 \%$

## Alternate answer 01 for (iii)

$$
\begin{array}{ll}
2 \mathrm{Al}_{2} \mathrm{~S}_{3}+9 \mathrm{O}_{2} \rightarrow 2 \mathrm{Al}_{2} \mathrm{O}_{3}+6 \mathrm{SO}_{2} & \text { or } \mathrm{Al}_{2} \mathrm{~S}_{3}: \mathrm{SO}_{2}=1: 3 \\
2 \mathrm{Fe}_{2} \mathrm{~S}_{3}+9 \mathrm{O}_{2} \rightarrow 2 \mathrm{Fe}_{2} \mathrm{O}_{3}+6 \mathrm{SO}_{2} & \text { or } \mathrm{Fe}_{2} \mathrm{~S}_{3}: \mathrm{SO}_{2}=1: 3 \\
\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O} & \text { or } \mathrm{H}_{2} \mathrm{SO}_{4}: \mathrm{NaOH}=1: 2 \tag{03}
\end{array}
$$

Molar mass of $\mathrm{Al}_{2} \mathrm{~S}_{3}=(27 \times 2)+(32 \times 3)=150$
Molar mass of $\mathrm{Fe}_{2} \mathrm{~S}_{3}=(56 \times 2)+(32 \times 3)=218$
Assuming mols of $\mathrm{Al}_{2} \mathrm{~S}_{3}$ is $n_{1}$ and mols of $\mathrm{Fe}_{2} \mathrm{~S}_{3}$ as $n_{2}$
Mols of Fe from $\mathrm{Fe}_{2} \mathrm{~S}_{3}$

$$
\begin{equation*}
n_{2} \times 56 \times 2 \tag{04}
\end{equation*}
$$

Total mass after heating under $\mathrm{H}_{2}$
$150 n_{1}+112 n_{2}=0.824 \rightarrow \square$
Mols of NaOH for titration $=\frac{1}{1000} \times 36$
Mols of $\mathrm{H}_{2} \mathrm{SO}_{4}$ from titration $\quad=\frac{1}{1000} \times \frac{36}{2}=18 \times 10^{-3}$
Mols of $\mathrm{H}_{2} \mathrm{SO}_{4}$ from $\mathrm{Al}_{2} \mathrm{~S}_{3}=3 n_{1}$
Mols of $\mathrm{H}_{2} \mathrm{SO}_{4}$ from $\mathrm{Fe}_{2} \mathrm{~S}_{3}=3 n_{2}$
Total mols of $\mathrm{H}_{2} \mathrm{SO}_{4}=3 n_{1}+3 n_{2}$
Therefore,

$$
\begin{equation*}
3 n_{1}+3 n_{2}=0.018 \quad \rightarrow[2] \tag{08}
\end{equation*}
$$

Solving equation [1]and [2] for $n_{1}$ and $n_{2}$
[2] $\times 50$

$$
150 n_{1}+150 n_{2}=0.9 \quad \rightarrow[3]
$$

[3] -[1]

$$
\begin{array}{r}
38 n_{2}=0.076 \\
-3 \mathrm{~mol} \tag{02}
\end{array}
$$

Substituting $n_{2}$ in [2]

$$
\begin{array}{r}
3 n_{1}+3 \times 0.002=0.018 \\
n_{1}=0.004 \mathrm{~mol} \tag{02}
\end{array}
$$

Mass of $\mathrm{Al}_{2} \mathrm{~S}_{3}=0.004 \mathrm{mols} \times 150 \mathrm{gmol}^{-1}=0.600 \mathrm{~g}$
Mass of $\mathrm{Fe}_{2} \mathrm{~S}_{3}=0.002$ mols $\times 208 \mathrm{gmol}^{-1}=0.416 \mathrm{~g}$
\% mass of $\mathrm{Al}_{2} \mathrm{~S}_{\mathcal{F}}=\frac{0.600}{0.600+0.416} \times 100 \%=59.06 \quad$ or $59 \%$
$\%$ mass of $\mathrm{Fe}_{2} \mathrm{~S}_{3}=100-59.06=40.94$ or $41 \%$

## Alternate answer 02 for (iii)

$$
\begin{array}{ll}
2 \mathrm{Al}_{2} \mathrm{~S}_{3}+9 \mathrm{O}_{2} \rightarrow 2 \mathrm{Al}_{2} \mathrm{O}_{3}+6 \mathrm{SO}_{2} & \text { or } \mathrm{Al}_{2} \mathrm{~S}_{3}: \mathrm{SO}_{2}=1: 3 \\
2 \mathrm{Fe}_{2} \mathrm{~S}_{3}+9 \mathrm{O}_{2} \rightarrow 2 \mathrm{Fe}_{2} \mathrm{O}_{3}+6 \mathrm{SO}_{2} & \text { or } \mathrm{Fe}_{2} \mathrm{~S}_{3}: \mathrm{SO}_{2}=1: 3 \\
\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O} & \text { or } \mathrm{H}_{2} \mathrm{SO}_{4}: \mathrm{NaOH}=1: 2 \tag{03}
\end{array}
$$

Molar mass of $\mathrm{Al}_{2} \mathrm{~S}_{3}=(27 \times 2)+(32 \times 3)=150 \mathrm{~g} \mathrm{~mol}^{-1}$
Molar mass of $\mathrm{Fe}_{2} \mathrm{~S}_{3}=(56 \times 2)+(32 \times 3)=218 \mathrm{~g} \mathrm{~mol}^{-1}$
Assume mass of $\mathrm{Al}_{2} \mathrm{~S}_{3}$ in the mass of 0.824 g is as m

$$
\begin{equation*}
n_{F e}=\frac{(0.824-m)}{56} \mathrm{~mol} \tag{06}
\end{equation*}
$$

$n_{\mathrm{Fe}_{2} \mathrm{~S}_{3}}=\frac{1}{2} \frac{(0.824-m)}{56} \mathrm{~mol}$
[1]
$n_{\text {SO }_{2}}=3 \times \frac{m}{150}+3 \times \frac{1}{2} \frac{(0.824-m)}{56} \mathrm{~mol}$
Mols of NaOH for titration $\quad=\frac{1}{1000} \times 36 \mathrm{~mol}$
Mols of $\mathrm{H}_{2} \mathrm{SO}_{4}$ from titration $=\frac{1}{1000} \times \frac{36}{2}=18 \times 10^{-3} \mathrm{~mol}$

Therefore,

$$
n_{\mathrm{SO}_{2}}=0.018 \mathrm{~mol}
$$

$$
\begin{equation*}
n_{\text {so }}=3 \times \frac{m}{}+3 \times \frac{1}{(0.824-m)}=0.018 \tag{10}
\end{equation*}
$$

[2]

Solving equation [2] for $m$

$$
\begin{aligned}
& \frac{m}{150}+\frac{(0.824-m)}{112}=0.006 \\
& 112 m+150(0.824-m)=0.006 \times 150 \times 112
\end{aligned}
$$

$$
\begin{align*}
& 38 m=22.8 \\
& m=m_{A l_{2} S_{3}}=0.60 g \tag{02}
\end{align*}
$$

Substituting $\mathrm{m}=0.60 \mathrm{~g}$ in equation [1]
$n_{\mathrm{Fe}_{2} S_{3}}=\frac{1}{2} \frac{(0.824-0.60)}{56} \mathrm{~mol}=0.002 \mathrm{~mol}$
$m_{\mathrm{Fe}_{2} S_{3}}=0.002 \times 208 \mathrm{gmol}^{-1}=0.416 \mathrm{~g}$
Therefore
\% mass of $\mathrm{Al}_{2} \mathrm{~S}_{3}=\frac{0.600}{0.600+0.416} \times 100 \%=59.06 \%$ or $59 \%$
\% mass of $\mathrm{Fe}_{2} \mathrm{~S}_{3}=100 \%-59.06 \%=40.94 \%$ or $41 \%$
(iv) If the above titration is carried out using methyl orange as the indicator instead of phenolpthalein, would there be a change in the burette reading? Explain your answer. (Relative atomic mass: $\mathrm{Al}=27, \mathrm{~S}=32, \mathrm{Fe}=56$ )
(75 marks)
No

Because this is a strong acid- strong base titration
So the color change pH interval of methyl orange and phenolphthalein both falls into vertical region of the titration curve.
10. (a) The following flow chart shows the industrial extraction/production of three important elements/ compounds $\mathbf{P}_{1}, \mathbf{P}_{2}$ and $\mathbf{P}_{3}$.
There is evidence to show that our ancestors produced $\mathbf{P}_{1}$ thousands of years ago. $\mathbf{P}_{1}$ is used as a catalyst in $\mathbf{M}_{2}, \mathbf{P}_{3}$ is used in the manufacture of explosives.

(R) - raw material $\quad \mathbf{P}$-product
 - product and raw material

(i) Name the manufacturing processes $\mathbf{M}_{2}$ and $\mathbf{M}_{3}$. (e.g.: Manufacture of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ is named as Solvay process.)
$\mathrm{M}_{2}$ - Manufacture of $\mathrm{NH}_{3}$ by Haber Process
$\mathrm{M}_{3}$ - Manufacture of $\mathrm{HNO}_{3}$ by Ostwald Process
(ii) Identify the process $\mathbf{M}_{1}$ and name the main constituent of its waste gas.

$$
\begin{align*}
& M_{1}-\text { extraction of } \mathrm{Fe}  \tag{02}\\
& \mathrm{~N}_{2} \text { gas }
\end{align*}
$$

(iii) Give the common names of the raw materials $\mathbf{R}_{1}, \mathbf{R}_{2}$ and $\mathbf{R}_{3}$ used in $\mathbf{M}_{1}$.
$\mathrm{R}_{1}$ - coke
$R_{2}$ - iron ore / hematite
$\mathrm{R}_{3}$ - limestone
(02)
(iv) Write a balanced chemical equation for the role of $\mathbf{R}_{1}$ as a reducing agent in $\mathbf{M}_{1}$ process.

$$
\begin{equation*}
\text { As a reducing agent: } \mathrm{FeO}(\mathrm{~s})+\mathrm{C}(\mathrm{~s}) \rightarrow \mathrm{Fe}(\mathrm{I})+\mathrm{CO}(\mathrm{~g}) \tag{02}
\end{equation*}
$$

$$
\begin{gathered}
\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{C}(\mathrm{~s}) \rightarrow 2 \mathrm{CO}(\mathrm{~g}) \\
\text { Or } \\
2 \mathrm{FeO}(\mathrm{~s})+\mathrm{C}(\mathrm{~s}) \rightarrow 2 \mathrm{Fe}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
\end{gathered}
$$

(v) Identify $\mathbf{R}_{4}$ and $\mathbf{R}_{5}$.

$$
\begin{align*}
& \mathrm{R} 4-\mathrm{N}_{2}(\mathrm{~g})  \tag{02}\\
& \mathrm{R} 5-\mathrm{H}_{2}(\mathrm{~g})
\end{align*}
$$

(vi) Give balanced chemical equations for reactions taking place in the processes $\mathbf{M}_{1}, \mathbf{M}_{2}$ and $\mathbf{M}_{3}$. Appropriate conditions (temperature, pressure, catalysts, etc.) must be stated as required. (Note: For the $\mathbf{M}_{1}$ process, give only the reactions showing the conversion of $\mathbf{R}_{2}$ to $\mathbf{P}_{1}$.)

M1: $\quad 3 \mathrm{Fe}_{2} \mathrm{O}_{3}+\mathrm{CO} \rightarrow \mathrm{Fe}_{3} \mathrm{O}_{4}+\mathrm{CO}_{2}$
$\mathrm{Fe}_{3} \mathrm{O}_{4}(\mathrm{~s})+\mathrm{CO} \rightarrow 3 \mathrm{FeO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$

$$
\begin{equation*}
\mathrm{FeO}(\mathrm{~s})+\mathrm{CO}(\mathrm{~s}) \rightarrow \mathrm{Fe}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \quad----(\mathrm{A}) \tag{02}
\end{equation*}
$$

$$
\begin{equation*}
2 \mathrm{FeO}(\mathrm{~s})+\mathrm{C}(\mathrm{~s}) \rightarrow 2 \mathrm{Fe}(\mathrm{I})+\mathrm{CO}_{2}(\mathrm{~g}) \tag{02}
\end{equation*}
$$

Either (A) or (B)
M2:

$$
\begin{equation*}
\mathrm{N}_{2}(\mathrm{~s})+3 \mathrm{H}_{2}(\mathrm{~g}) \stackrel{200-300 \mathrm{~atm}(\mathbf{0 1 )}}{\stackrel{200-500^{\circ} \mathrm{C}(01)}{\stackrel{1}{2}}} 2 \mathrm{NH}_{3}(\mathrm{~s}) \tag{02}
\end{equation*}
$$

Fe catalyst (01)
$\mathrm{K}_{2} \mathrm{O}$ and $\mathrm{Al}_{2} \mathrm{O}_{3}$ promoters (01)
(Any pressure between $200-300 \mathrm{~atm}$ and any temperature between $400-500^{\circ} \mathrm{C}$ accepted) M3:

$$
\begin{align*}
& 4 \mathrm{NH}_{3}(\mathrm{~g})+5 \mathrm{O}_{2} \xlongequal[\text { Pt or Pt-Rh catalyst }]{ } \stackrel{800-900{ }^{\circ} \mathrm{C}(\mathbf{0 1})}{\stackrel{2}{=}} 4 \mathrm{NO}+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})  \tag{02}\\
& 2 \mathrm{NO}_{(\mathrm{g})}+\mathrm{O}_{2} \rightarrow \quad 2 \mathrm{NO}_{2}  \tag{02}\\
& 4 \mathrm{NO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 4 \mathrm{HNO}_{3} \tag{02}
\end{align*}
$$

(vii) Give two uses each of $\mathbf{P}_{1}, \mathbf{P}_{2}$ and $\mathbf{P}_{3}$ (other than what is indicated in the flow chart or given in the question).

P1 - to make alloy steel / construction industry to provide strength to structures / in machinery and tool manufacture

P2 - production of fertilizers / production of nylon / in petroleum industry to neurtralize acide in crude oil constituents / water and waste water treatment / as refrigerant / to prevent coagulation of rubber

P3 - manufacture of fertilizer / in industries which require nitrates
such as $\mathrm{KNO}_{3}$ in explosive manufacture and $\mathrm{AgNO}_{3}$ in
photography / to clean surfaces when welding metals /
aqua regia
(01 x 2)
(viii) State whether the $\mathbf{M}_{2}$ process would be favoured at very high temperatures. Explain your answer using $\Delta H, \Delta S$ and $\Delta G$.

Reaction is exothermic. $\Delta \mathrm{H}$ is (-ve)
No of gaseous moles decrease. $\Delta \mathrm{S}$ decreases (-ve)
According to $\Delta \mathrm{G}=\Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}$
When $\Delta S$ is negative, $-T \Delta S$ term is +ve.
As temperature increases, +ve term overrides -ve term, making $\Delta \mathrm{G}$ +ve. (01)
Therefore not favoured at high temperature.
(b) The following questions are based on photochemical smog and water pollution.
(i) State the major types of gaseous chemical pollutants and conditions that are required for the formation of photochemical smog.
$\mathrm{NO}_{\mathrm{x}}\left(\mathrm{NO}\right.$ or $\left.\mathrm{NO}_{2}\right)$, Volatile hydrocarbon (VOC), sunlight/solar radiation, temperature above $15^{\circ} \mathrm{C}$
(02 x 4)
(ii) State why the strength of photochemical smog is low in the morning and evening.

The intensity of solar radiation is low during morning and evening.
Therefore photochemical smog is weak in the morning and evening.
(iii) Using balanced chemical equations, explain how ozone is formed in the lower atmosphere due to photochemical smog.
$2 \mathrm{NO}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NO} 2(\mathrm{~g})$
$\mathrm{NO}_{2}(\mathrm{~g}) \rightarrow \mathrm{NO}(\mathrm{g})+\mathrm{O}(\mathrm{g})$
$\mathrm{O}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{O}_{3}(\mathrm{~g})$
(03 x 3)
(iv) State four major products (excluding ozone) of photochemical smog.

PAN (peroxy acetyl nitrate)
PBN (peroxy benzoyl nitrate)
Short chain(volatile) aldehydes
Particles (particulate matter)
(02 x 4)
(v) State three free radicals produced during the formation of photochemical smog.
$\mathrm{OH}^{*}$ (hydroxyl radical), $\mathrm{ROO}^{\circ}$ (peroxy radical), $\mathrm{R}^{*}$ (alkyl radical), $\mathrm{RO}^{*}$ (Alkoxy radical), $\mathrm{O}^{\circ}$ (oxygen radical), NO
(02 x 3)
(vi) Many countries now promote the use of electric vehicles. State how the use of electric vehicles affect the formation of photochemical smog.
Electric vehicles do not release ingredients for photochemical smog.
Therefore, electric vehicles contribute for the reduction of photochemical smog/ no
(vii) State an environmental problem, other than photochemical smog, that could ease due to the use of electric vehicles.
Global warming/acid rain
(viii) A ship carrying the following chemicals sank in the sea.
$\mathrm{Na}_{2} \mathrm{HPO}_{4}, \mathrm{HNO}_{3}, \mathrm{~Pb}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}$
State an effect from each chemical on the water quality parameters of the water surrounding the ship, by the release of the above chemicals.
(50 marks)
$\mathrm{PO}_{4}{ }^{3-}, \mathrm{NO}_{3}{ }^{-}$, Reduction of dissolved oxygen level.
$\mathrm{HNO}_{3}$ Increases the acidity/decreases pH
$\mathrm{Pb}^{2+}$ - Increases the heavy metal level of sea water /Increases the lead level of water
(03 x 3)
10(b): 50 marks
(c) The following questions are based on natural rubber and additives used for polymer related products.
(i) Sketch the repeating unit of natural rubber.

(ii) Give a compound that can be used to prevent coagulation of natural rubber latex.
$\mathrm{NH}_{3}$ solution
(04)
(iii) State a compound that can be used to coagulate natural rubber latex and explain how it acts.

Acids such as acetic/formic acid.
(04)
$\mathrm{H}+$ can neutralize the COO- groups, making the surface of rubber particles neutral. Particles can then combine together and become as a mass.
(02 x $4=08$ )
(iv) Briefly state how the 'vulcanization' of natural rubber is carried out.
rubber is heated with 1-3\% sulfur
(03 $\times 3=09$ )
(v) State two types of substances used to increase the efficiency of vulcanization.

Organic catalysts
Catalyst promoters or ZnO
(03 $\times 2=06$ )
(vi) Give three properties, which can be enhanced by adding additives to polymer products.

Increase flexibility
Decrease flammability
Increase mechanical and/or physical strength
(Any three) ( $03 \times 3=09$ )
