*பூக ஓதகி* மூன்று மணித்தியாலம் **Three hours**  අමතර කියවීම් කාලය - මිනිත්තු 10 යි மேலதிக வாசிப்பு நேரம் - 10 நிமிடங்கள் Additional Reading Time - 10 minutes

Use additional reading time to go through the question paper, select the questions and decide on the questions that you give priority in answering.

# Index Number

#### **Instructions:**

- \* This question paper consists of two parts;
  Part A (Questions 1 10) and Part B (Questions 11 17).
- \* Part A:

  Answer all questions. Write your answers to each question in the space provided. You may use additional sheets if more space is needed.
- \* Part B:
  Answer five questions only. Write your answers on the sheets provided.
- \* At the end of the time allotted, tie the answer scripts of the two parts together so that Part A is on top of Part B and hand them over to the supervisor.
- \* You are permitted to remove only Part B of the question paper from the Examination Hall.

සංයුක්ත ගණිතය I இணைந்த கணிதம் I Combined Mathematics I

#### Part B

- \* Answer five questions only.
- 11. (a) Let  $p \in \mathbb{R}$  and 0 . Show that 1 is**not** $a root of the equation <math>p^2x^2 + 2x + p = 0$ .

Let  $\alpha$  and  $\beta$  be the roots of this equation. Show that  $\alpha$  and  $\beta$  are both real. Write down  $\alpha + \beta$  and  $\alpha\beta$  in terms of p, and show that

$$\frac{1}{(\alpha-1)}\cdot\frac{1}{(\beta-1)}=\frac{p^2}{p^2+p+2}.$$

Show also that the quadratic equation whose roots are  $\frac{\alpha}{\alpha-1}$  and  $\frac{\beta}{\beta-1}$  is given by  $(p^2+p+2)x^2-2(p+1)x+p=0$  and that both of these roots are positive.

(b) Let c and d be two **non-zero** real numbers and let  $f(x) = x^3 + 2x^2 - dx + cd$ . It is given that (x-c) is a factor of f(x) and that the remainder when f(x) is divided by (x-d) is cd. Find the values of c and d.

For these values of c and d, find the remainder when f(x) is divided by  $(x + 2)^2$ .

- 12. (a) Let  $P_1$  and  $P_2$  be the two sets given by  $\{A, B, C, D, E, 1, 2, 3, 4\}$  and  $\{F, G, H, I, J, 5, 6, 7, 8\}$  respectively. It is required to form a password consisting of 6 elements taken from  $P_1 \cup P_2$  of which 3 are different letters and 3 are different digits. In each of the following cases, find the number of different such passwords that can be formed:
  - (i) all 6 elements are chosen only from  $P_1$ ,
  - (ii) 3 elements are chosen from  $P_1$  and the other 3 elements from  $P_2$ .
  - (b) Let  $U_r = \frac{1}{r(r+1)(r+3)(r+4)}$  and  $V_r = \frac{1}{r(r+1)(r+2)}$  for  $r \in \mathbb{Z}^+$ .

Show that  $V_r - V_{r+2} = 6U_r$  for  $r \in \mathbb{Z}^+$ .

Hence, show that  $\sum_{r=1}^{n} U_r = \frac{5}{144} - \frac{(2n+5)}{6(n+1)(n+2)(n+3)(n+4)}$  for  $n \in \mathbb{Z}^+$ .

Let  $W_r = U_{2r-1} + U_{2r}$  for  $r \in \mathbb{Z}^+$ .

**Deduce** that  $\sum_{r=1}^{n} W_r = \frac{5}{144} - \frac{(4n+5)}{24(n+1)(n+2)(2n+1)(2n+3)} \text{ for } n \in \mathbb{Z}^+.$ 

Hence, show that the infinite series  $\sum_{r=1}^{\infty} W_r$  is convergent and find its sum.

**13.** (a) Let 
$$\mathbf{A} = \begin{pmatrix} a & 0 & -1 \\ 0 & -1 & 0 \end{pmatrix}$$
,  $\mathbf{B} = \begin{pmatrix} 2 & 1 & 3 \\ 1 & -a & 4 \end{pmatrix}$  and  $\mathbf{C} = \begin{pmatrix} b & -2 \\ -1 & b+1 \end{pmatrix}$  be matrices such that

 $\mathbf{A}\mathbf{B}^{\mathrm{T}} = \mathbf{C}$ , where  $a, b \in \mathbb{R}$ .

Show that a = 2 and b = 1.

Show also that,  $C^{-1}$  does not exist.

Let  $P = \frac{1}{2}(C - 2I)$ . Write down  $P^{-1}$  and find the matrix Q such that 2P(Q + 3I) = P - I, where I is the identity matrix of order 2.

(b) Let  $z, z_1, z_2 \in \mathbb{C}$ .

Show that (i)  $\operatorname{Re} z \leq |z|$ , and

(ii) 
$$\left|\frac{z_1}{z_2}\right| = \frac{\left|z_1\right|}{\left|z_2\right|}$$
 for  $z_2 \neq 0$ .

**Deduce** that  $\operatorname{Re}\left(\frac{z_1}{z_1+z_2}\right) \le \frac{\left|z_1\right|}{\left|z_1+z_2\right|}$  for  $z_1+z_2\ne 0$ .

Verify that 
$$\operatorname{Re}\left(\frac{z_1}{z_1 + z_2}\right) + \operatorname{Re}\left(\frac{z_2}{z_1 + z_2}\right) = 1$$
 for  $z_1 + z_2 \neq 0$ ,

and show that  $|z_1 + z_2| \le |z_1| + |z_2|$  for  $z_1, z_2 \in \mathbb{C}$ .

(c) Let  $\omega = \frac{1}{2} \left( 1 - \sqrt{3} i \right)$ .

Express  $1+\omega$  in the form  $r(\cos\theta+i\sin\theta)$ ; where r(>0) and  $\theta\left(-\frac{\pi}{2}<\theta<\frac{\pi}{2}\right)$  are constants to be determined.

Using De Moivre's theorem, show that  $(1+\omega)^{10} + (1+\overline{\omega})^{10} = 243$ .

**14**.(a) Let 
$$f(x) = \frac{9(x^2 - 4x - 1)}{(x - 3)^3}$$
 for  $x \neq 3$ .

Show that f'(x), the derivative of f(x), is given by  $f'(x) = -\frac{9(x+3)(x-5)}{(x-3)^4}$  for  $x \ne 3$ .

Sketch the graph of y=f(x) indicating the asymptotes, y-intercept and the turning points.

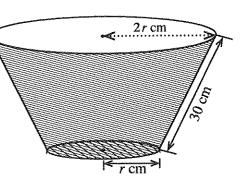

It is given that 
$$f''(x) = \frac{18(x^2 - 33)}{(x - 3)^5}$$
 for  $x \ne 3$ .

Find the x-coordinates of the points of inflection of the graph of y=f(x).

(b) The adjoining figure shows a basin in the form of a frustum of a right circular cone with a bottom. The slant length of the basin is 30 cm and the radius of the upper circular edge is twice the radius of the bottom. Let the radius of the bottom be rcm.

Show that the volume  $V \text{ cm}^3$  of the basin is given by  $V = \frac{7}{3}\pi r^2 \sqrt{900 - r^2}$  for 0 < r < 30.

Find the value of r such that volume of the basin is maximum.

- 15. (a) Using the substitution  $x = 2\sin^2\theta + 3$  for  $0 \le \theta \le \frac{\pi}{4}$ , evaluate  $\int_{3}^{4} \sqrt{\frac{x-3}{5-x}} \, dx$ .
  - (b) Using partial fractions, find  $\int \frac{1}{(x-1)(x-2)} dx$ .

Let 
$$f(t) = \int_{3}^{t} \frac{1}{(x-1)(x-2)} dx$$
 for  $t > 2$ .

**Deduce** that  $f(t) = \ln(t-2) - \ln(t-1) + \ln 2$  for t > 2.

Using integration by parts, find  $\int \ln(x-k) dx$ , where k is a real constant. Hence, find  $\int f(t) dt$ .

(c) Using the formula  $\int_{a}^{b} f(x) dx = \int_{a}^{b} f(a+b-x) dx$ , where a and b are constants,

show that 
$$\int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + e^x} \, dx = \int_{-\pi}^{\pi} \frac{e^x \cos^2 x}{1 + e^x} \, dx.$$

Hence, find the value of  $\int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + e^x} dx$ .

16. Write down the coordinates of the point of intersection A of the straight lines 12x-5y-7=0 and y=1.

Let l be the bisector of the acute angle formed by these lines. Find the equation of the straight line l.

Let P be a point on l. Show that the coordinates of P can be written as  $(3\lambda+1, 2\lambda+1)$ , where  $\lambda \in \mathbb{R}$ .

Let  $B \equiv (6,0)$ . Show that the equation of the circle with the points B and P as ends of a diameter can be written as  $S + \lambda U = 0$ , where  $S \equiv x^2 + y^2 - 7x - y + 6$  and  $U \equiv -3x - 2y + 18$ .

**Deduce** that S=0 is the equation of the circle with AB as a diameter.

Show that U=0 is the equation of the straight line through B, perpendicular to l.

Find the coordinates of the fixed point which is distinct from B, and lying on the circles with the equation  $S + \lambda U = 0$  for all  $\lambda \in \mathbb{R}$ .

Find the value of  $\lambda$  such that the circle given by S=0 is orthogonal to the circle given by  $S+\lambda U=0$ .

17. (a) Write down  $\sin(A+B)$  in terms of  $\sin A$ ,  $\cos A$ ,  $\sin B$  and  $\cos B$ , and obtain a similar expression for  $\sin(A-B)$ .

Deduce that

$$2 \sin A \cos B = \sin (A+B) + \sin (A-B)$$
 and  
 $2 \cos A \sin B = \sin (A+B) - \sin (A-B)$ .

Hence, solve  $2\sin 3\theta \cos 2\theta = \sin 7\theta$  for  $0 < \theta < \frac{\pi}{2}$ .

(b) In a triangle ABC, the point D lies on AC such that BD = DC and AD = BC. Let  $B\hat{A}C = \alpha$  and  $A\hat{C}B = \beta$ . Using the Sine Rule for suitable triangles, show that  $2\sin\alpha\cos\beta = \sin(\alpha + 2\beta)$ .

If  $\alpha : \beta = 3 : 2$ , using the last result in (a) above, show that  $\alpha = \frac{\pi}{6}$ .

(c) Solve  $2\tan^{-1}x + \tan^{-1}(x+1) = \frac{\pi}{2}$ . Hence, show that  $\cos\left(\frac{\pi}{4} - \frac{1}{2}\tan^{-1}\left(\frac{4}{3}\right)\right) = \frac{3}{\sqrt{10}}$ .

Use additional reading time to go through the question paper, select the questions and decide on the questions that you give priority in answering.

### **Instructions:**

Index Number

This question paper consists of two parts;

Part A (Questions 1-10) and Part B (Questions 11-17)

Answer all questions. Write your answers to each question in the space provided. You may use additional sheets if more space is needed.

Part B:

Answer five questions only. Write your answers on the sheets provided.

- At the end of the time allotted, tie the answer scripts of the two parts together so that Part A is on top of Part B and hand them over to the supervisor.
- You are permitted to remove only Part B of the question paper from the Examination Hall.
- In this question paper, g denotes the acceleration due to gravity.

## Part A

1.	Three particles $A$ , $B$ and $C$ , each of mass $m$ , are placed in that order, in a straight line on a smooth horizontal table. The particle $A$ is given a velocity $u$ such that it collides directly with the particle $B$ . After colliding with the particle $A$ , the particle $B$ moves and collides directly with the particle $C$ . The coefficient of restitution between $A$ and $B$ is $C$ . Find the velocity of $C$ after the first collision.
	The coefficient of restitution between $B$ and $C$ is also $e$ . Write down the velocity of $C$ after its collision with $B$ .
2.	A particle is projected from a point $O$ on a horizontal floor with a velocity whose horizontal and vertical components are $\sqrt{ga}$ and $\sqrt{6ga}$ , respectively. The particle just clears two vertical walls of heights $a$ and $b$ which are at a horizontal distance $a$ apart,
	as shown in the figure. Show that the vertical component of the velocity of the particle when it passes the wall of height $a$ is $2\sqrt{ga}$ .
	Show further that $b = \frac{5a}{2}$ .

A and B.

1000P $\frac{-5001}{R - Mg\sin\alpha} \text{ m s}^{-1}.$ 

5.	Two particles, A and B, each of mass m, attached to the two ends of a light inextensible string which passes over a smooth fixed pulley, hang in equilibrium. A small bead C, also of mass m, released from rest from a point at a distance a vertically above A, moves freely under gravity and collides and coalesces with A. (See the figure.) Write down equations sufficient to determine the impulse of the string at the instant of the collision between A and C, and the velocity acquired by B just after the above collision.

Combined Mathematics II

#### Part B

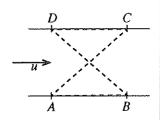

\* Answer five questions only.

(In this question paper, g denotes the acceleration due to gravity.)

- 11. (a) Two cars P and Q move with constant accelerations in the same direction along a straight road. At time t = 0 the velocity of P is  $u \text{ m s}^{-1}$  and the velocity of Q is  $(u + 9) \text{ m s}^{-1}$ . The constant acceleration of P is  $f \text{ m s}^{-2}$  and the constant acceleration of Q is  $\left(f + \frac{1}{10}\right) \text{ m s}^{-2}$ . Sketch the velocity-time graphs for
  - (i) the motions of P and Q for  $t \ge 0$ , in the same diagram, and
  - (ii) the motion of Q relative to P for  $t \ge 0$ , in a separate diagram.

Further, it is given that at time t = 0 the car P is 200 metres ahead of the car Q. Find the time taken by Q to overtake P.

(b) A river of breadth a with parallel straight banks flows with uniform velocity u. In the figure, the points A, B, C and D lying on the banks are the vertices of a square. Two boats  $B_1$  and  $B_2$  moving with constant speed v > u relative to water begin their journeys at the same instant from A. The boat  $B_1$  first travels to C along  $\overline{AC}$  and then to D in the direction  $\overrightarrow{CD}$  upward along the river. The boat  $B_2$  first travels to B in the direction  $\overline{AB}$  downwards along the river and then to D along  $\overline{BD}$ . Sketch the velocity triangles for the motions of  $B_1$  from A to C and of  $B_2$  from B to D in the same diagram.

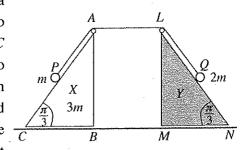

**Hence**, show that the speed of the boat  $B_1$  in its motion from A to C is  $\frac{1}{\sqrt{2}} \left( \sqrt{2v^2 - u^2} + u \right)$  and find the speed of the boat  $B_2$  in its motion from B to D.

Further, show that both boats  $B_1$  and  $B_2$  reach D at the same instant.

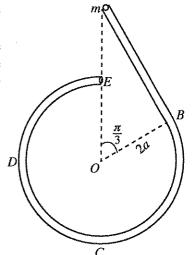

12.(a) The triangles ABC and LMN in the figure, are vertical cross-sections through the centres of gravity of two identical smooth uniform wedges X and Y respectively, with  $A\hat{C}B = L\hat{N}M = \frac{\pi}{3}$  and  $A\hat{B}C = L\hat{M}N = \frac{\pi}{2}$ 

such that the faces containing BC and MN are placed on a smooth horizontal floor. The wedge X of mass 3m is free to move on the floor and the wedge Y is kept fixed. The lines AC and LN are the lines of greatest slope of the relevant faces. Two ends of a light inextensible string passing over two smooth small pulleys fixed at A and L, are attached to particles P and Q of masses m and 2m, respectively. At the initial position, the particles P and Q are held on AC and LN respectively such that

AP = AL = LQ = a and the string taut, as in the figure. The system is released from rest. Obtain equations sufficient to determine the time taken by X to reach Y in terms of a and g.

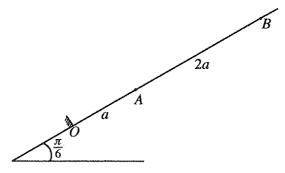

(b) A smooth narrow tube ABCDE is fixed in a vertical plane as shown in the figure. The portion AB of length  $2\sqrt{3}a$  is straight and tangential at B to the circular portion BCDE of radius 2a. The ends A and E lie vertically above the centre O. A particle P of mass m is placed inside the tube at A and gently released from rest. Show that the speed v of the particle P when  $\overrightarrow{OP}$  makes an angle  $\theta\left(\frac{\pi}{3} < \theta < 2\pi\right)$  with  $\overrightarrow{OA}$  is given by  $v^2 = 4ga\left(2 - \cos\theta\right)$  and find the reaction on the particle P from the tube at this instant.

Also, find the reaction on the particle P from the tube in its motion from A to B.

Show that the reaction on the particle P from the tube changes abruptly when the particle P passes through B.

13. The points O, A and B lie in that order, with O lowermost, on a line of greatest slope of a smooth fixed plane inclined at an angle  $\frac{\pi}{6}$  to the horizontal such that OA = a and AB = 2a. One end of a light elastic string of natural length a and modulus of elasticity mg is attached to the point O and the other end to a particle P of mass m. The string is pulled along the line OAB until the particle P reaches the point B. Then the particle P is released from rest.

Show that the equation of motion of P from B to A is given by  $\ddot{x} + \frac{g}{a}\left(x + \frac{a}{2}\right) = 0$  for  $0 \le x \le 2a$ , where AP = x.

Let  $y = x + \frac{a}{2}$  and rewrite the above equation of motion in the form  $\ddot{y} + \omega^2 y = 0$  for  $\frac{a}{2} \le y \le \frac{5a}{2}$ , where  $\omega = \sqrt{\frac{g}{a}}$ .

Find the centre of the above simple harmonic motion and using the formula  $\dot{y}^2 = \omega^2 (c^2 - y^2)$ , find the amplitude c and the velocity of P when it reaches A.

Show that the velocity of P when it reaches O is  $\sqrt{7ga}$ .

Show also that the time taken by P to move from B to O is  $\sqrt{\frac{a}{g}} \left\{ \cos^{-1} \left( \frac{1}{5} \right) + 2k \right\}$ , where  $k = \sqrt{7} - \sqrt{6}$ .

When the particle P reaches O, it strikes a smooth barrier fixed at O perpendicular to the plane. The coefficient of restitution between P and the barrier is e. Show that if  $0 < e \le \frac{1}{\sqrt{7}}$ , then the subsequent motion of P will **not** be simple harmonic.

14. (a) Let OACB be a parallelogram and let D be the point on AC such that AD:DC=2:1. The position vectors of points A and B with respect to D are D and D are D and D in terms of D and D.

Now, let  $\overrightarrow{OC}$  be perpendicular to  $\overrightarrow{BD}$ . Show that  $3|\mathbf{a}|^2 \lambda^2 + 2(\mathbf{a} \cdot \mathbf{b})\lambda - |\mathbf{b}|^2 = 0$  and find the value of  $\lambda$ , if  $|\mathbf{a}| = |\mathbf{b}|$  and  $A\hat{OB} = \frac{\pi}{3}$ .

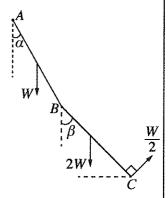

(b) A system consists of three forces in the plane of a regular hexagon ABCDEF of centre O and side of length 2a. Forces and their points of action, in the usual notation, are shown in the table below, with the origin at O, the Ox-axis along  $\overrightarrow{OB}$  and the Oy-axis along  $\overrightarrow{OH}$ , where H is the mid-point of CD. (P is measured in newtons and a is measured in metres.)

Point of Action	<b>Position Vector</b>	Force
A	ai – √3aj	$3P\mathbf{i} + \sqrt{3}P\mathbf{j}$
C	$a\mathbf{i} + \sqrt{3}a\mathbf{j}$	$-3P\mathbf{i} + \sqrt{3}P\mathbf{j}$
E	-2 <i>a</i> i	-2√3P <b>j</b>

Show that the system is equivalent to a couple and find the moment of the couple.

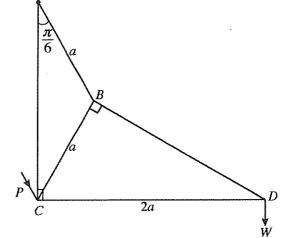

Now, an additional force of magnitude 6P N acting along  $\overline{FE}$  is introduced to this system. Find the magnitude, direction and the line of action of the single force to which the new system reduces.

15.(a) Two uniform rods AB and BC, each of length 2a are jointed smoothly at B. The rod AB is of weight W and the rod BC is of weight 2W. The end A is hinged smoothly to a fixed point. This system is kept in equilibrium in a vertical plane with rods AB and BC making angles  $\alpha$  and  $\beta$ , respectively, with the downward vertical by a force  $\frac{W}{2}$  applied at C in the direction perpendicular to BC shown in the figure. Show that  $\beta = \frac{\pi}{6}$  and find the horizontal and the vertical components of the reaction at the joint B on the rod BC exerted from the rod AB.

Also, show that  $\tan \alpha = \frac{\sqrt{3}}{9}$ .

(b) Framework shown in the figure consists of five light rods AB, BC, BD, DC and AC smoothly jointed at their ends. Here, it is given that AB = CB = a, CD = 2a and  $B\hat{A}C = \frac{\pi}{6}$ . Framework is smoothly hinged at A to a fixed point. A load W is suspended at the joint D, and the framework is kept in equilibrium in a vertical plane with AC vertical and CD horizontal by a force P parallel to the rod AB, applied at the joint C in the direction shown in the figure. Draw a stress diagram, using Bow's notation, for the joints D, B, and C.

## Hence, find

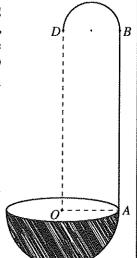

- (i) the stresses in the five rods, stating whether they are tensions or thrusts, and
- (ii) the value of P.

- 16. Show that the centre of mass of
  - (i) a thin uniform semi-circular wire of radius a is at a distance  $\frac{2a}{\pi}$  from its centre, and
  - (ii) a thin uniform hemispherical shell of radius a is at a distance  $\frac{a}{2}$  from its centre.

A spoon is made by rigidly fixing, to a thin uniform hemispherical shell of centre O and radius 2a, a thin handle ABCD made of uniform wire consisting of a straight piece AB of length  $2\pi a$  and a semi-circular piece BCD of radius a, such that the diameter BD is perpendicular to AB, as shown in the figure. The point A lies on the rim of the hemisphere, OA is perpendicular to AB, and OD is parallel to AB. Also, BCD lies in the plane of OABD. The mass per unit area of the hemisphere is  $\sigma$  and the mass per unit length of the handle is  $\frac{a\sigma}{2}$ .

Show that the centre of mass of the spoon lies at a distance  $\frac{2}{19\pi} (8\pi - 2\pi^2 - 1)a$  below OA, and a distance  $\frac{5}{19}a$  from the line passing through O and D.

The spoon is placed on a rough horizontal table with the hemispherical surface touching it. The coefficient of friction between the hemispherical surface and the table is  $\frac{1}{7}$ . Show that the spoon can be kept in equilibrium with OD vertical by a horizontal force applied at A in the direction of  $\overrightarrow{AO}$ .

- 17.(a) Initially a box contains 3 balls identical in all aspects except for their colour, each of which is either white or black. Now, one white ball identical to balls in the box in all aspects except for its colour, is added into the box and then one ball is drawn at random from the box. Assuming that the four possible initial compositions of the balls in the box are equally likely, find the probability that
  - (i) the ball drawn is white, and
  - (ii) initially there were exactly 2 black balls in the box, given that the ball drawn is white.
  - (b) Let the mean and the standard deviation of the set of values  $\{x_i : i = 1, 2, ..., n\}$  be  $\mu$  and  $\sigma$  respectively. Find the mean and the standard deviation of the set of values  $\{\alpha x_i : i = 1, 2, ..., n\}$  where  $\alpha$  is a constant.

Monthly salaries of 50 employees at a certain company are summarised in the following table:

Monthly Salary (in thousand rupees)	Number of Employees
5 — 15	9
15 - 25	11
25 - 35	14
35 - 45	10
45 — 55	6

Estimate the mean and the standard deviation of the monthly salaries of the 50 employees.

At the beginning of a year, the monthly salary of each employee is increased by p%. It is given that the mean of the new monthly salaries of the above 50 employees is 29 172 rupees. Estimate the value of p and the standard deviation of the new monthly salaries of the 50 employees.
